"W.A.E.," Bombay, India: "Spare parts are very hard to get just now, and if they have to be ordered from England they may arrive in six months, or twelve months. I should like to bring one case to your notice, which, I think, is perfectly scandalous. After ordering some spares for his machine (of very well-known make and reliability) from an agent, a friend of mine thought the prices charged very high. Before the war there was an understood rule that one rupee was the equivalent of one shilling, and this particular agent also agreed to the understanding. My friend, therefore, asked the agent for his price list, and found in this price list (printed and supplied to the agent by the makers in England) that the article required cost £2 10s., which at the above rate is Rs. 50. Still not satisfied, my friend asked what price was shown in my price list, whereupon I found the cost was only £1 10s. My price list was posted to me from England. Firstly, there is no need for this extra 50% odd, for an equivalent rate of one rupee to the shilling gives an increase of 35%, which should afford ample margin for duty, freightage, depreciation, and unsold stock. Needless to say, spare parts were ordered direct from England thereafter. (This took place before the war.)"

"If only customers in New Zealand would be patient and order their machines from home, I feel sure the agents would have to bring down their prices somewhat. Unfortunately, it cannot be done here on a large scale, for there is always the native gentleman to reckon with. He is willing to pay whatever is asked as long as he gets his scarlet or yellow car furnished with all the brass fittings possible!"

"Seeing that the average motor cyclist out here is an amateur pure and simple, and very rarely goes beyond the cantonment limits, he is satisfied with the ordinary 3½ h.p. single or twin. My work is away from the large station, and over an area of nearly 30,000 square miles. I have to use my machine on good, indifferent, and bad roads, and country cart tracks, through nullahs, over rocks, and with the ever-present risk of a babul thorn (which will go through the leather of one's boot), or of a badly cut tyre caused by a dropped bullock shoe."

"The machine should be sprung behind as well as in front. It should have three speeds and a very good clutch, handle and not kick-starter, immense mudguards with plenty of space between them and the tyres, chain, or chain-cum-belt drive (the latter having a back wheel belt pulley of not more than 14in. diameter), big oil and grease caps (for grease is the only thing which will keep water out of the hubs in the rainy season), a three-gallon petrol tank, 28in. x 3in. wheels, larger tool bags than are now provided, every nut split-pinned or spring-washed, and a ground clearance of at least 6in. under the engine, and 7in. under the footboard. Personally, I am an 8 h.p. enthusiast, and my ideal machine would be very different from that just specified, which will suit the ordinary amateur for hard work."

"Unfortunately, I was compelled to buy a machine in India instead of being able to order it out from home. I

took delivery of a 1916 3½ h.p. War Office single-cylinder machine. It was not tuned up, but that was excused under the circumstances. It goes very nicely, otherwise."

"Many of the roads I have to ride over cross nullahs, and the water is about six or eight inches deep, except in the largest ones. My back wheel belt rim is nineteen inches in diameter, and I have never yet got through any water deeper than three inches without wetting my feet and afterwards having to dry the belt. You say, 'Fit a leather belt'—yes, and buy a new countershaft pulley every six months, and also scrape the belt every day throughout the dry season!"

"My tank only holds a gallon and a half, so I cannot go further than fifty miles out and back without replenishment, which is generally impossible."

"The machine should be rear sprung (most important, regarding the number of nuts lost)."

"The nuts on the fork shackles and brake rods are all split-pinned, but those supporting the carrier and footboards have already been renewed twice, having nothing in the way of even washers."

## Scarcity of Tyres.

MR. FOSTER BLACK, Cape Town, South Africa: "Tyres are somewhat scarce here in Cape Town. In certain sizes they command practically any price the dealer wishes to charge, and he gets it, too, for a tyre is a tyre, and a motor cycle is of no use without one."

## Manufacturers will not be told.

SEC.-LT. J. L. WRIGHT, B.E.F., France: "A certain well-known firm of British motor cycle manufacturers say, with characteristic egotism, that they have found their machines equally satisfactory for Colonial roads. Now before I left Australia I rode a friend's 1915 model; this machine was continually breaking its front fork springs. Rather contradictory, is it not? The fact is that British makers will not be told. I have been very much struck by the Colonial 6 h.p. Enfield combination. It is a very sensible idea to give the sidecar chassis a good ground clearance. Although one can dodge ruts solo, it is another proposition on a sidecar outfit. It is easy to see how it obtains the clearance, and there is no reason why other firms could not do the same. I recollect riding on a main road not twelve miles from Sydney, N.S.W., where the wheel ruts are so deep that one's footboards are level with the tops of the ruts as the machine is ridden along the bottom. Take the same condition on a wet day, when one has to ride on the top and the machine swerves into the ruts. The crank case often suffers, and frequently its day's work is done; but not the rider's, who has to do the pushing home."

An Egyptian reader of *The Motor Cycle*, M. El Attar, of Cairo, and the Brown machine he has been using for the last eight years.

## THE 1916 MODEL 5-6 h.p. CLYNO.

A Sturdily-designed Three-speed Combination successfully used for Government Work. Amendments in Design, including Spring Seat-pillar.

The 6 h.p. War Office model Clyno sidecar, our experiences with which over a lengthy period are described on this page.

IT is common knowledge that the works of the Clyno Engineering Co., of Wolverhampton, have for many months past been exerting full pressure in the production of sidecar

tion. Moreover, those makers who have had the advantage of war-zone experience have been able to incorporate improvements that otherwise might have taken years to evolve.

rider is the fact that every single nut is split-pinned or spring-washed. A Senspray carburetter, Best and Lloyd lubricator, Sphinx plugs, and Lucas fittings are among the equipment selected by the Government. The tyres used

Method of stiffening the head of the Clyno frame with exterior webs.

combinations mainly for the purpose of conveying machine guns, but also to be employed for transporting officers on tours of inspection. These sidecars are of the pleasure type, very much on the lines of those which gained such an enviable name in arduous competitions prior to the war. It is only during the last few weeks that the Clyno Co. has managed to get ahead of the enormous demands of the British and Allied Governments, and it goes without saying that private buyers have had to take a back seat during the company's great effort to satisfy Government requirements.

It has lately been our good fortune to have the use of one of the sidecars such as are supplied for the use of officers. There are a number of amendments in design embodied in this all-khaki model since it was last described in print, and consequently it would be of interest to touch briefly upon the specifica-

### Completeness of Detail.

The most striking feature of the outfit is its completeness. Every imaginable detail required on a trip of almost any length seems to be there, and, what is more important, there is a place for everything, and everything must be kept in its place.

Dealing first with the bicycle. There are fewer alterations in design on this portion than on the sidecar chassis, but we noticed that the latest pattern Brampton fork is now fitted, combining vertical and lateral movement, and greasers of a sensible size have been fitted to all the shackle pins. On the gear box an oil well is now provided for lubricating the clutch, and it is the work of a moment to inject oil *via* an accessibly placed spring-controlled lid.

A specially designed Brooks saddle giving a parallel motion is carried on a spring seat-pillar, whose action is controlled by double spiral springs. A point which will please the practical

Brass oil cup for lubricating clutch.

throughout are Palmer's 3in. light car type, one steel-studded cover being included in the set, besides a spare tube. The petrol tank has a capacity of over two gallons, and the consumption with full load is in the neighbourhood of 55 m.p.g.

The mudguards are of very practical design, being wide, and are flatter than the average type, with plenty of clearance to prevent mud clogging the wheel.

### The Engine.

The engine itself is very little altered in outward appearance from the popular 5-6 h.p. Clyno engine which figured with success in competitions of pre-war days. It is of V type, with cylinders set at an angle of 55°, having a bore and stroke of 76x82 mm., giving a capacity of 744 c.c. The timing gear, however, has been redesigned, and on the road is wonderfully quiet in operation; indeed, we know of few V type engines in which the valve operation is so quiet, and it must be admitted that the clatter of the valve gear in the average V type

Clyno spring seat-pillar. The sketch also shows the two-way petrol tap and can for injecting petrol.

The 1916 Model 5-6 h.p. Clyno.— engine is one of its greatest drawbacks.

### The Transmission.

The three-speed countershaft gear box is of the sliding pinion type as usually fitted to motor cycles, but, of course, much lower gear ratios are needed for Overseas use than would be required at home.

The ratios respectively are 5½, 10½, and 17 to 1. Even with such a low top gear the machine is capable of quite forty miles an hour. The machine is extremely controllable, ticks along on the top gear at a very slow speed, and, as

a result, is extremely handy in traffic. The multiple-disc clutch is well up to its work, and appears capable of starting any load from rest in the smoothest possible manner.

The control of the Clyno, by the way, is exactly as on a car, the left pedal controlling the clutch, and the one at the forward end of the right footboard the brake. The pedals themselves are of substantial sizes. The kick-starter pedal is on the right-hand side of the machine.

### A Very Strong Chassis.

Turning now to the sidecar chassis, a stronger, more solid job it would be difficult to imagine. It is attached to the bicycle at five different points, one attachment being devised to keep the steering head rigid. There is a double saddle connection

result in some part or other giving way. Again, it must be remembered that these sidecars are not intended for normal requirements. Crossing commons, moorland, and badly cut up roads is their usual fare, and though work of this kind may be performed by an ordinary pleasure type sidecar, continuous use under such conditions would quickly bring to light weaknesses.

A word should be added with regard to the care and thought expended in storing the necessary spare parts and fittings, which should be an object lesson to the average motor cyclist, who is only too ready to cram his tools loosely into a pannier bag. In addition to the standard metal tool kit on the top tube a very complete kit is carried at the rear of the sidecar in a large wooden case, each tool being fitted in a specially shaped bed and removable by pressing one end, an action which causes the required tool to tip up. This arrangement is particularly good in view of the fact that tool kits are inspected in much

The neatly arranged tools and spares box as fitted to every W.D. Clyno sidecar outfit. As will be seen there is a special compartment for each tool and spare, the design and lay-out of the box and its contents being such as to render the finding of what is required an easy matter.

Foot-operated clutch control, showing use of stranded wire cable and pulley instead of rods.

and a double front connection, in addition to the usual axle support, to prevent whip in the frame or torsional stresses which would immediately

the same way as a rifle, and it would at once be obvious if anything were missing. Minor parts, such as nuts, bolts, cups, cones, and spare balls, are carried in lined metal cases.

The spare wheel is fixed rigidly to the carrier, and can be instantly detached by the removal of a single wing nut.

### PETROL PRIMER TAP.

THE petrol primer tap illustrated has lately been placed on the market by Brown Bros., Ltd., 15, New-man Street, Oxford Street, W. In the position shown in the sketch the tap is "on." When the tap handle is downwards the tap is "off." The swinging portion which allows the priming pipe to be brought over the

A new petrol primer.

compression tap is also a tap in itself, and is only open when over the compression tap. This appears to be rather a disadvantage, as should one require to draw petrol from the tank for any reason, or moisten a rag with the spirit, it is impossible to do so unless the swing spout is in this one particular position.

### THE WIZARD STEAM VULCANISER.

ONE of the smallest and neatest steam vulcanisers yet supplied for the use of motor cyclists is the Wizard. It consists of an iron casting with a curved polished face, against which the tube to be mended is clamped, and a small detachable furnace consisting of asbestos, which is intended to be soaked in petrol. The main body is a hermetically sealed casting containing a small quantity of water.

After the puncture has been properly roughened and treated with sandpaper, it is wiped with petrol, and next a coat of cement, supplied with the outfit, is applied, and allowed to dry for ten minutes. Next a piece of raw rubber about 1in. in diameter is placed over the hole, and a piece of paper is laid over the raw rubber, so that it shall not stick to the vulcaniser. The tube is now clamped on to the vulcaniser; care should be taken to screw down both sides evenly. Next the fire-box should be filled level to the top with petrol and then turned upside down, so that all the petrol not absorbed is allowed to run away. The vulcaniser should then be stood on end, and the fire-box

placed in position and lighted, when it will burn for twenty minutes. It should be left five minutes after the flame has gone out. Finally the paper on the rubber should be washed off. It is necessary that the tube should be nearly

Wizard vulcaniser showing furnace detached.

cold before being replaced in the cover. What happens, of course, is that the water in the casting is converted into steam, and finally superheated, and this gives the correct temperature. The Wizard vulcaniser is sold by Brown Bros., Ltd.

## SPECIAL FEATURES

MUNITION WORKERS HILL-CLIMBING IN LAKELAND.

" 3rd	...	9.37 "
" 5th	...	9.39 "
" 7th	...	9.41 "

## Special Care at Tadcaster.

The Automobile Association learns that motorists are being stopped and proceeded against for driving to the common danger in Tadcaster. This activity is stated to be due to the fact that a motor cyclist recently met with a fatal accident in this town through colliding with a cart.

## At a Repair Base.

Gordon I. Francis, who holds a commission in the A.S.C., M.T., is at a repair base in France. There is plenty of work to do, and the only breaks in the monotony of things are the occasional visits of enemy aircraft, to which, Francis tells us, the men rather look forward.

## Clutch Control.

A car driver who has lately taken to driving sidecar outfits informs us that he greatly prefers foot control for the clutch. This is only natural seeing that on all cars the clutch is foot-operated. It is only a matter of a few runs before a rider accustomed to cars would be quite at home with a hand-operated clutch on a motor cycle, but in case of emergency he will be more likely to do the right thing with a foot control than hand. Combined foot and hand control is a refinement that should increase after the war.

## Death of a Well-known Motor Cyclist.

We greatly regret to hear of the death of that pioneer motor cyclist, Stanley Webb, at the comparatively early age of 47, managing director of the Stanley Motor Belt and Fastener Co., 32, London Road, Bromley. Mr. Webb was chiefly responsible for the introduction of the rubber and canvas belt, and, though not the first actually to introduce the belt on the market, he manufactured an improved form which resulted in the almost universal introduction of this form of transmission. He was a motor cyclist whose experience dated from the very earliest days, and he was always a keen and enthusiastic rider. He frequently attended and took part in competitions, and among his favourite mounts were the Triumph and Douglas. Though stone deaf, he found his affliction no detriment to his enjoyment of the motor cycle. Mr. Webb's business will still be carried on by the company. We offer our most sincere sympathy to Mrs. Webb in her sad loss.

## Economy and Utility.

Tradesmen in difficulties with delivery of goods owing to lack of men should consider the claims of a sidecarrier, if they have not already done so. A couple of sidecarriers will do the work of three light horse vans, and, further, they can easily be driven by intelligent boys. This subject, together with many other aspects of the utility of the motor cycle, will be fully dealt with in a special number of *The Motor Cycle* to be published on June 29th.

## A Naval Motor Cyclist Injured.

We regret to see in the casualty list dated May 21st, reported in the press last Friday, that Flight-Lieutenant J. Forgan-Potts, R.N., was accidentally injured. Forgan-Potts was, before the war, an enthusiastic rider of an Indian, and a frequent participant in B.A.R.C. and B.M.C.R.C. race meetings at Brooklands. We wish him a speedy recovery.

## A New Ambulance Convoy.

The National Sporting Club is appealing for contributions to a fund to keep ambulance transport up to the requisite standard of efficiency. It is to be known as the British Sportsmen's Ambulance Fund, and the committee hopes to be able to provide a fleet of motor ambulances as a gift from the British sporting community. Contributions should be sent to the Treasurer of the Fund, The National Sporting Club, Covent Garden, W.C.

## Lamp Dimming Discs for Scotland.

Motor cyclists travelling in Scotland are reminded that, as from last Thursday, further lighting regulations for Scotland came into force. These regulations provide that when travelling through the following towns: Aberdeen, Arbroath, Dundee, Dunfermline, Dysart, Edinburgh, Kirkcaldy, Leith, and Montrose, all lamps must be covered with a disc similar to the discs now being enforced in many parts of England and Wales. Lamps must be alight from half-an-hour after sunset until half-an-hour before sunrise.

## Results of an Irish Trial.

The result of the Easter Monday reliability trial held under the auspices of the Dublin and District M.C.C. has been announced as follows. Only two of the five finishers, C. B. Franklin (7.9 h.p. Indian sc.) and A. Carton (7 h.p. Indian sc.), secured full marks, both being within the limits of time at the secret and open checks, and completing the non-stop sections without stops. Franklin wins the Dunlop Rubber Co.'s challenge cup by reason of his variation from schedule being the smaller. Silver medals were won by J. Carter (7.9 h.p. American Excelsior), 98 marks; and S. Redmond (3½ h.p. Indian), 97 marks. A bronze medal was awarded to T. Wood (2½ h.p. Allon).

The report (delayed owing to the Irish rebellion) of this trial appeared in *The Motor Cycle* of May 11th, page 447.

MOTOR CYCLISTS ATTACHED TO THE R.F.C. EXPERIMENTAL WORKS, the C.O. of which is Capt. A. M. Lov.

The machine on the extreme right, driven by Corporal Goodwin, is a standard model 3½ h.p. P. and M., as supplied to the Flying Corps; next comes a 7 h.p. Indian, then a 7 h.p. Zenith, while the machine on the extreme left is a 3½ h.p. Humber. The last three machines are mainly used for conveying the transport drivers from their billets to the factory.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund (£5,258,000 distributed)	£5,877,251	0	0
Fund for the Sick and Wounded	3,750,000	0	0
Tobacco Fund	104,197	0	0
The Queen's Work for Women Fund	169,449	3	6
The British Farmers' Red Cross Fund	300,000	0	0

**A Progressive Colonial Club.**

We have received a copy of the 1916 handbook of the Cape Peninsula M.C.C. The doings of this club, the headquarters of which are at Cape Town, South Africa, are often described in our pages, and from these and the contents of the booklet one gathers that it is a very live organisation. At the time the book was printed forty-five members of the club were known to be on active service.

**A Victorian Flexibility Test.**

The Victorian M.C.C. held a flexibility hill-climb at Rosanna, near Heidelberg, on March 25th. The rider showing the greatest difference between his fastest and slowest effort was adjudged the winner. Results:

- SOLOS, UNDER 600 c.c.  
 1. C. Woods (2½ Doughlas)  
 2. E. Tyler (3½ Triumph)  
 SOLOS, ABOVE 600 c.c.  
 1. J. Booth (Powerplus Indian)  
 2. A. Jenkins (6 J.A.P.)  
 SIDECARS.  
 1. J. H. Rhodes (Powerplus Indian sc.)  
 2. A. McCall (6 J.A.P. sc.)

**Sunday Motoring.**

As showing how the anti-motor brigade is straining to manufacture a case, *The Times* on Monday stated that of the motor cyclists noticed on the road on Sunday the majority were of military age. What of it? Every man seen is (1) called up, (2) has been rejected, (3) is a munition worker, or (4) a tribunal has decided he is doing better work at home. Such being the case, why deprive him of a little relaxation from his labours?

**Motor Cyclist Volunteers Wanted.**

Mr. S. W. Phillpott, who has recently been appointed motor cyclist officer for the Port of Liverpool Heavy Car Battalion of the National Motor Volunteers, informs us that vacancies exist in the motor cyclists' section of his corps. Motor cyclists interested should communicate with Mr. Phillpott at 22, Rodney Street, Liverpool.

**A Sporting Offer.**

On Monday last, at West Bromwich, a motor cyclist was fined 20s. for riding to the danger of the public. The police alleged that defendant was travelling at 20 m.p.h. and turned a dangerous corner without slowing down. Defendant said his machine was an old one, and he was prepared to let the policeman ride it, and if he could get 20 m.p.h. out of it he would give it to him. Apparently this sporting offer proved of little avail.

**Motor Cycling in the East Indies.**

Roads in Sumatra and Java are excellent, especially in the latter island. Java is more highly developed than Sumatra; there are over 10,000 miles of good roads. The latter, combined with beautiful scenery, make motor cycling very delightful.

**Hill-climbing in Western Australia.**

A local record was made on the occasion of a hill-climb held by the West Australian M.C.C. on the Welshpool road, Kalamunda, on March 26th. Results:

- 500 c.c. CLASS.  
 1. H. Norton (B.S.A.) Record for hill.  
 2. Wigmore (Triumph)  
 3. Hope (Sunbeam)  
 OPEN CLASS.  
 1. Hope (Sunbeam)  
 2. Norton (B.S.A.)  
 3. Wigmore (Triumph)

**Of Your Charity—**

We are informed that the North Birmingham A.C. is starting a fund to assist the widow and children of Sgt. Hubbard, of the Royal Engineers, who was killed in a motor accident at Dunstable last year. Sgt. Hubbard had seen much severe fighting in France, and returned home wounded, but as he was not on military duty when he met his death, his widow and children are not receiving any pension. Donations should be sent to Mr. A. W. Thrush (hon. secretary), 34, Reservoir Road, Erdington, Birmingham.

**THE LIMIT IN OVERLOADING!**

(Left) 4 h.p. 1916 model Triumph sidecar with eleven men aboard.  
 (Right) Solo Triumph with seven men. The machine has actually climbed Stoneleigh Hill, Warwickshire, as shown, and when the top was reached it was found that only one man had been dropped.

## WHAT M CYCL A FIELD DAY

This is not the first time the in the pages of *The Motor Cycle word* in freak riding. The field day organised by the T operator. The tests the milita consisting as they did of rid (1 in 10 steepest) with six men

## TARY MOTOR WILL DO.

THE TRIUMPH TESTERS.

Ordinary performances of works' testers have been illustrated. We think that the scenes here illustrated represent the "last" photographs were taken one day last week on the occasion of a Triumph Company, mainly for the benefit of a cinematograph film of a 4 h.p. Triumphs were put through were very diverse, though a ford, climbing a well-known Midland test hill, and climbing a big grass mound of about 1 in 4.

WE have always been led to understand that one of the minor advantages of conscription would be the doing away of the insinuations that such and such a man ought to be in khaki, etc. In the earlier days of the war many unpleasant incidents arose through persons being dubbed slackers when they may have been, if the truth were known, physically unfit for military service. Now that conscription has come there should be no more of this, because every man of military age who is not in khaki will have been dealt with by a tribunal, or else have been rejected.

### An Empty Statement.

However, this seems to have been overlooked in one quarter, and the strange part about it is that it is in a quarter from which the aforesaid advantage of conscription was so emphasised in the course of the daily press campaign for universal service. We are led to make these remarks by the report of a motor traffic census that appeared in *The Times* of last Monday. The census covered the main outlets of London, and took place on Sunday morning. In the report appears the following: "It was particularly observed that, practically every civilian motor cyclist was of military age." Now this statement really weakens *The Times's* anti-motoring campaign, for with conscription in force it is obvious that such riders are either (1) rejects, (2) on Government work, (3) have been temporarily exempted from military service by tribunals, or (4) are due to report for military service in the course of a few weeks. The emptiness of such a remark as that quoted needs no further emphasis on our part, for its unreasonableness is obvious.

Combined electric lamp and horn as fitted to the 1916 model Henderson described on May 18th.

*The Times* traffic census is part of a campaign against "pleasure" motoring now being conducted by a section of the press. If there is, or likely to be, any shortage of petrol for military and naval purposes, the Government has only to commandeer the whole supply, or to make a plain statement that petrol is scarce, and we are convinced that all users of motor vehicles will be prepared to reduce the little recreative motoring they indulge in—and regard as necessary—or give it up altogether. But until it is definitely announced by the Government that such is the case, we fail to see any reason why motoring should be singled out for censure any more than theatres, expensive restaurant dinners, golf, and other forms of pleasure.

In the meanwhile, the report of the Petrol Committee is eagerly awaited. Various reports have appeared in the daily press as to the recommendations of the Committee in the form of a restricted petrol supply, but it is all pure conjecture.

*En passant*, a full page in the same issue of *The Times* as the above extracts contains attractive displayed notices of expensive hotels all over the country inviting readers to spend their Whitsun holidays there. This is consistency in economy on the part of *The Times*, we presume.

## A COMBINED LAMP AND HORN.

THIS novel and practical accessory was referred to briefly in our description of the latest four-cylinder Henderson in our issue of May 18th. To combine both lamp and horn is certainly an ingenious idea, and, if these two important accessories can be combined, we do not see why it should not be done, as it is a decided advantage, there being fewer accessories on the handle-bars, and in consequence less to clean.

Our illustration shows how easily the reflector of the lamp may be removed, so that the wiring connections and the buzzer itself can be reached. It will be noticed also that there is a series of louvres immediately behind the front of the lamp, and through these the sound issues on the horn being operated. The whole idea seems to be a happy combination in which the efficiency of either part is in no way impaired. As a horn it emits a penetrating but not objectionable note, and as a lamp it gives an excellent light, and is, moreover, provided with a dimmer bulb for town riding. At the rear of the lamp is the switch, while the milled ring shown in the illustration is used for focussing the main bulb.

# "THE MOTOR CYCLE" RECRUITING SECTION.

Central Office for Heavy Section, Machine Gun Corps and Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

Central Office for R.E. Despatch Riders:

Mr. T. W. Loughborough,  
A.C.U., 83, Pall Mall, London, S.W.

**L**AST week motor cyclist and car driver recruits who presented themselves at Coventry and Nottingham were able to choose between the Motor Machine Gun Service and the Heavy Section Machine Gun Corps, the former section embracing the sidecar machine gun batteries and the latter all the different branches of armoured car work. Among the recruits were a goodly number of men who had hitherto been employed in reserved occupations or engaged on Government work, and have since been released.

It is not expected that there will be any further vacancies in the Motor Machine Gun Service for the time being, as on Tuesday last, the 30th ult., the Editor of this journal, Mr. Geoffrey Smith, attended at the Coventry Recruiting Office, with the object of filling up the ranks of the M.M.G.S.

There were over fifty men at Coventry last week, and those accepted were billeted out the same evening in Coventry, and left next morning for their different training camps. The same day another batch of men were being tested in Nottingham.

There are still vacancies in the Heavy Section Machine Gun Corps for experienced motor cyclists and car drivers, and a limited number of men with engineering knowledge may be accepted for this corps.

The following inspections have been arranged for next week:

**COVENTRY.**—Recruiting Office, Masonic Buildings, Tuesday, June 6th, 11.30 a.m. to 4.30 p.m.

**MANCHESTER.**—Messrs. Iliffe and Sons Ltd., Century Buildings, 199, Deansgate, June 7th, 2.30 to 4.30 p.m.

Men desiring to enlist who conform to the conditions of enlistment given on this page need not write at all, but should attend at one or other of the addresses named.

The conditions of enlistment are appended:

Applicants must be experienced car drivers or motor cyclists, able to execute ordinary running repairs. A limited number of men with engineering knowledge, and preferably previous military training will be accepted.

Pay 1s. 2½d. per day, all found.

Enlistment for duration of war. Usual separation or dependants' allowance.

Age limit, 19 to 40. Applicants must be fit for general service abroad or for garrison duty abroad.

## "THE MOTOR CYCLE" RECRUITING SECTION.

**T**HIS Section was instituted with the sole object of assisting readers and directing them to the many different branches of the Army and Navy, for which their special knowledge suited them. At the outbreak of war numerous letters reached us (and continue to arrive) from men at home and overseas possessed of motor engineering knowledge, explaining their difficulty in obtaining particulars of Specialised Sections (notably the Motor Sections), Recruiting Officers being invariably occupied by the demands of the line regiments. The Editor is Inspecting Officer for the M.M.G.S., Heavy Section, Machine Gun Corps, and R.E. Despatch Riders. Throughout the work has been purely honorary, and Recruiting Commissions have not been accepted. To date 9,656 readers have taken advantage of our proffered assistance.

Below will be found a list of recruits accepted for service last week:

Andrews, J., Oxford.  
Armstrong, F. N., Southampton.  
Audley, R. E., Sidmouth.  
Baker, H. M., Llanfairfechan.  
Baker, L. C. H., Seven Kings.  
Balderson, W. E., Lincoln.  
Bott, R., Devizes.  
Brennand, G., Kendal.  
Brown, J. E., Kenilworth.  
Chapple, S. T., Bristol.  
Clark, J. C., Wembley.  
Cobb, A., Boston.  
Cooper, A., Bethnal Green.  
Coton, P. C., Bourne-mouth.  
Crowle, Jr. H., Fraddon.  
Crowther, S. H., Workop.  
Douglas, D. S., Mansfield.  
Dyer, W. H., Cleveland.  
Everson, G., Kendal.  
Fincher, J., Liverpool.  
Fletcher, W. H., Manchester.  
Foot, G. C., Rhyl.  
Franks, E., Workop.  
Goehbels, J., Wisbech.  
Goode, J. G. A., Wellingborough.  
Gregory, G., Giltbrook.  
Hunter, W. J., Newcastle-on-Tyne.  
Hyde, J., Derby.  
Iron, E. S. W., Tottenham.  
Jackson, E., Grimsby.  
Johns, T. J., Henthon.  
Kerr, T., London.  
Kershaw, C., Liversedge.  
Kirby, A. L., Kirtou Lindsey.  
Latham, P. A., Coventry.  
Leward, C., Stoke Newington.  
Lindon, E. O., Rugby.  
Llewellyn, B. H., Birmingham.  
Lodge, J. A., Deunholme.  
Marsden, A., Darwen.  
Marsh, S. A., Richmond.  
Marshall, A. E., Bath.  
Millward, A., Denton.  
Moore, W. C., Ilkeston.  
Mowbray, L., Sibsey.  
Murrell, J. W., Haywards Heath.  
Neal, J., Nuneaton.  
Padget, W. G. D., Birmingham.  
Pennell, A. J., Walsall.  
Pickett, A. L., Watlington.  
Pickford, L. T., Rugby.  
Pilling, J. P. T., Bridlington.  
Poole, W. E. G., Wrockwardine Wood.  
Purcell, H. S., Andlem.  
Purcell, J. A., Audlem.  
Purday, H., Nottingham.  
Reynolds, S., London.  
Robinson, E., Nottingham.  
Roddick, P. W., East Dereham.  
Rose, A. E., Charteris.  
Rowbottom, A. M., Ripon.  
Runnall, R. H., Liskeard.  
Sawyer, A., Grimsby.  
Sheppard, A. C., Bath.  
Silvester, G., Fleet.  
Smaller, S., Grimsby.  
Spark, T. E., Sunderland.  
Stevenson, G. B., Rugby.  
Sweeting, A., Anlaby.  
Thorn, A., London.  
Thornev, E., New Mills.  
Tiffin, M. J., Kirkoswald.  
Vincent, G. J., Chesham.  
Walton, F., Walsall.  
Wanklyn, A. M. G., Golder's Green.  
Watson, W. K., Kendal.  
Webb, A., London.  
Welbeck, H. I., Ravensthorpe.  
Wells, A. R., Chatteris.  
White, F. C., Middlesbrough.  
Willer, H. L., Cudney.  
Wilson, R. L., Beverley.

SOME MEN OF THE No. 8 BATTERY MOTOR MACHINE GUN SECTION.

From left to right: Chief-mechanic Ernest Smith; Battery Sgt.-Maj. C. F. Hewitt and Mechanic R. Bownass. We referred to Smith and Bownass, both of whom are well-known to many readers as T.T. riders, in a recent issue. Hewitt was formerly at a Cheltenham garage.

The Motor Machine Gun Service is the motor cyclists' own special corps, and an opportunity is presented by which fellow motor cyclists may assist in brightening the lives of the men in training. A band is being raised, but a few instruments are required to complete it, and Lt.-Col. R. J. Colson, Commanding Officer of the training centre, will appreciate offers of two cornets, a clarinet, a trombone, and a big bass violin.

# ATTEMPT TO REDUCE THE PETROL BILL.

A Further Test of "Spots."

The second "Spots" test on Brooklands with a 1916 model 6 h.p. Enfield.

**W**E were so much interested by the results obtained in the case of the test with a P. and M. described in our last issue that we were determined to carry out a further one on a different make of machine fitted with a different carburetter. In this case we used a 6 h.p. 1916 Enfield, fitted with a Watford speedometer which was previously tested over a mile and found to be accurate.

The procedure, as before, was to measure out eight ounces (1-20th gallon) in a graduated glass, pour it into the supplementary tank, start on the line and run as far as possible on the measured amount. So as to use the maximum amount of petrol out of the supplementary tank the machine was pushed off to start. At the first attempt on pure petrol 3.8 miles were covered (76 miles per gallon); on the second test

the mileage covered was 3.7 miles (74 miles per gallon).

The first trial with "Spots" produced 3.7 miles, and the second test 3.8 miles.

It will be seen, therefore, that there was no difference with this particular machine and carburetter, which was an Amac, between petrol treated with "Spots" and plain petrol. During the test the machine was driven as nearly as possible at twenty miles an hour, and as much air was given as the carburetter would take. Both for the tests with the P. and M. and with the Enfield the weather conditions were ideal.

Although invited to be present, Mr. C. P. Preston, who is responsible for the sale and production of "Spots," was unable to put in an appearance.

## TOUCH WOOD!

**C**AN any reader beat the following as a narrow escape from what might have proved a most serious accident? It prompts a suggestion for a sort of competition, viz., "Who has had the luckiest experience by *not* being in a bad smash?"

I took a 1912  $3\frac{1}{2}$  h.p. motor cycle with sidecar from a town in the neighbourhood of Leeds, and, being pressed for time to fulfil an appointment with business friends in Cheshire, hurried over some of the famous horrible setts and through some of the thickly populated towns of the West Riding, including Huddersfield. This town, by the way, has a motor-ing reputation: there are so many motor bicycles and cars that it is said there is one for every seventeen inhabitants, or seventeen motors to each inhabitant, I forget which. Anyway, there are plenty. The hills they must face regularly are terrible. One, at least three miles long, leads bumpily towards Stanedge

Moors. Here the sandy highway is unfenced and the scenery wild. We had a tyre burst, big enough for me to put my fist through, but that was as nothing to what followed. After repairing we sailed all right over the lonesome country, with not even a bit of barbed wire (!) to stop the sidecar passenger, if he had been thrown out, from rolling down a steep, boulder-strewn slope for scores of yards. It is nearly like riding on the edge of a cliff. But there was no accident. . . . till we entered Ashton, when both gears went awry. We pushed the turnout into a cart shed, and took away the sidecar so as to get at the gear more easily.

Will it be believed that, as the *empty* sidecar was then being wheeled out of the way, the stay supporting the axle of the wheel gave way?

The remarkable thing, of course, is that the fracture did not reveal itself whilst the machine was pounding its way over the moors.

S.L.

# Letters To the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

## Naphtha as a Fuel.

Sir,—I am told that a car owner in this district (Jedburgh) is getting good results from naphtha. How would this fuel affect the running of a  $3\frac{1}{2}$  h.p. engine, and has it been tried? I am sure if your readers could give any information on the subject it would be welcomed by a very large number of riders, in view of the high price of petrol. KS 188.

## Enclosed or Open Chains.

Sir,—Re the above-named article, I do not agree with the writer where he states that "It is quite a fallacy that any harm can be done to the material of a chain by boiling it in grease," because to do so would spoil the best chain ever made.

I have no objection to immersing the chain in melted grease; in fact, it is a good way to lubricate a chain, although personally I never did it, but care ought to be taken not to allow the grease to be more than fluid; but to boil—well, the boiling point of grease is somewhere about 600° Fahr., and the rollers of a chain will be tempered at a temperature between 430° to 450° Fahr.

I merely point this out, as there are a number of readers who get their tips out of *The Motor Cycle*, and follow the directions to the letter. I have done the same myself many a time when I thought the tip was right.

J. SWAINE.

## The Taxation of Motor Cycles.

Sir,—If many people speak, perhaps the motorist may gain a little consideration. That is my reason for writing.

The suggested increases in motor licences are extortionate. The owner of a second-hand 4 h.p. cycle and sidecar costing £25 will have to pay about £3 3s. tax, and should, for his own peace of mind, pay £3 3s. third party risk insurance premium. He thus has to pay £6 6s. a year before he can start driving. We know that indirect taxation is very unsatisfactory, but as regards motoring—which tends to impoverish the community's roads—a tax on fuel is reasonable. It would be far preferable to increased licences. The amount paid by the consumer would then be proportionate to the damage caused to the roads.

Again, does the Government realise that in increasing licences it lays a premium on motoring as many miles as possible? Owners will not, and should not, be asked to give up their motors altogether, because they are nowadays kept as much for utility as for luxury. Therefore, granted that a licence is taken out, the motorist will use it for as many miles as possible. The charge per mile on that item decreases, and—in excess of a certain distance—motor travelling becomes cheaper than rail.

Petrol distribution should be controlled by the Government, at fair prices, and that at once. The private owner does not wish to motor at the expense of the Army or Navy, and does not mind his supplies being curtailed to the utmost limit, but he wants it done fairly and above board.

On the question of Sunday motoring, does it matter to anyone when the owner uses his petrol? Did the 1916 licences restrict motoring to week-days only? If I take a friend to a country railway station six miles from my home on a Sunday evening, is that joy-riding? Bah! Let us have a little intelligence displayed. S. G. BARNARD.

Sir,—This seems to me to be very unjust on licence holders who took their licences out before the proposed increase, as the licence states that the holder is entitled to the use

of a motor cycle for one year, from Jan. 1st to Dec. 31st. My case is, I dare say, only one of many. I use my motor cycle at fine week-ends only to take my wife out, who is unable to walk far, and it is only by the greatest economy and giving up all other forms of enjoyment that I can manage to go in for this, as my income is well under £120 a year. My total mileage would be about 1,200 miles in the year. If the increase on existing licences is persisted in, obviously treating a contract as a scrap of paper, I, for one, shall have to lay my machine up till happier times dawn. If there is not enough petrol for the use of the Army and Navy and other necessary services vital to the nation, it is quite right that private users should be restricted, and if it had been necessary for the tax on petrol to be increased by, say, 2s. a gallon to attain that end, it would be just, as no contract is broken. But if this is persisted in I must on August 14th lay the machine up instead of on September 30th. R. E. WINTER.

## Four-cylinder Motor Cycles.

Sir,—May I crave a space to reply to Messrs. Lee and Vowels, and to those of my correspondents who have written privately to me and to whom I have been unable to reply by post?

Let me say, firstly, that the temporary arrangement for operating the F.N. inlet valves mechanically was, like Mr. Brough's sidecar steering, purely a freak conversion for experimental purposes. It achieved its end; but it was not such an apparatus as one would care to have permanently attached to the machine. Further, lest Mr. Vowels be disappointed, I may say that it was a casting from a pattern which would tax the resources of the most capable amateur to turn out satisfactorily. I regret that I do not feel justified in giving details, as the person primarily responsible in making the attachment practicable (Mr. T. Stewart, the Manchester F.N. agent) is deserving of whatever commercial advantage may accrue from his ingenuity should the device later on be patented and placed upon the market in an improved and standardised form.

As to Mr. Vowels's difficulty in picking up at slow speeds on top gear, I think it extremely probable that escape of compression past the piston rings is at the root of the trouble. This might be due to worn rings, distorted pistons, or worn cylinders. What would be negligible in a mechanically-valved single or twin makes some considerable difference to the automatically-valved four-cylinder. The remedy is obvious, but the effect may be minimised by fitting lighter springs on the offending cylinders. It would also be advisable to have the magneto cleaned and dried, and to be absolutely positive that the vacuum pipe nipple does not allow leakage where it joins the silencer.

In reply to Mr. Lee, it is obviously impossible for me in the space at my disposal to detail the alterations made to my old F.N. The machine, apart from the engine, drive, and forks, was rebuilt on typical British lines—sloping frame, broad wedge tank, Best and Lloyd lubricator, gear lever well forward, ultra-low saddle position, etc. To check the side play which develops in the lower front fork links, new links of three times the bearing surface with Stauffer lubricators were cast in phosphor-bronze. As regards power production, the main thing is to have the engine in perfect tune, and the prime essential in tuning an F.N. is to have perfect compression. There must be no leakage at all past the rings. For all-round running the inlet valves should be set to float off their seats at 11½ oz. An absolutely sound engine will

stand springs up to 1½ lb. A well-known aviator always keeps the springs on his F.N. inlet valves at the latter strength, but his compression is his constant care.

In older type models, where the distributor is separate from the magneto, the brasses in the distributor should be true with the vulcanite. If they are rough or uneven the cap should be bored out a trifle. It is absolutely vital that the vacuum pipe should function properly. It should not leak at either of its joints. A vast improvement on the functioning of this pipe results from removing the internal central tube in the silencer, making the latter simply a big hollow box, the only outlet being a direct escape into the short extension pipe, which should be securely fastened into the end of the silencer. The nipple of the vacuum pipe is held in this extension pipe. The increase in noise is negligible. An F.N., otherwise perfect, can be made a spluttering abomination by using an incorrect jet. Most singles and twins show but slight variation in running on jet sizes within a couple of thousandths larger or smaller than the size with which they should be fitted. There is only one correct size for the F.N., and that can only be found by experiment. The standard jet is much too large, especially for the spirit supplied nowadays. For instance, my own machine ran best when the jet was reduced to 22-1,000ths. On the older type carburetter (without the extra air lever) an extra air fitting, such as a compression tap, should be let into the induction pipe. It is a good plan for sidecar work to time the magneto just a shade slower than the makers' setting.

Finally, I can confidently recommend owners of old F.N.'s to have the cylinders bored out to 55 mm. and to have new pistons, etc., fitted. This is not expensive, and it pays for itself in increased pleasure on the road.

H. E. THOMPSON.

#### Simple Improvements.

Sir.—In your issue of May 11th, there are two refinements illustrated in a communication by Capt. A. Lindsay, M.B., showing, on page 441, firstly, an air funnel attached to a Binks carburetter, with a lamp wick to catch the blow-back petrol. In the first sketch will be seen a small air scoop like a half cylinder attached to the B. and B. carburetter. I have used air scoops on my engines for seven years, and find the power and general running better than without them. It has always been a mystery to me why the air inlet to carburetters is almost always placed pointing to the rear or to the side of the machine. If a machine is travelling at twenty miles an hour on a calm day the draught suction on the carburetter intake is dead against the cylinder suction, the result being that the charge (air and petrol) is "wire drawn," and at the end of the suction stroke the charge in the carburetter and induction pipe is drawn back by the air draught, causing a partial vacuum (and loss of petrol) which has again to be filled at the next suction stroke. The air scoop acts as an injector, and gives a denser mixture, at the same time assisting the cylinder suction, and putting less strain on the jet, and consequently less loss in petrol, much of which may be unconsumed. On one machine I had a funnel-shaped scoop, and kept it greased inside, thus arresting a considerable amount of dust and grit.

The other illustration, on page 442, shows a copper cooling device, the advantages of which I can bear out. In my second sketch will be seen two copper fins attached to the sparking plugs, which are screwed down through the fins. In addition to the copper asbestos washers, the fins being next to the cylinder tops. Since using these fins there has

Fig. 1.—Scoop attached to the carburetter to prevent wire-drawing of the charge.

Fig. 2.—Copper flanges to assist in cooling the sparking plug

Fig. 3.—Home-built runabout fitted with 8 h.p. J.A.P. engine by Mr. H. Porter.

been an absence of knocking, where at times knocking took place formerly.

The photograph is of an 8 h.p. J.A.P. twin engine fitted to my home-built cycle car, weight about 6 cwt. The petrol consumption, with two up, is from fifty to sixty miles per gallon.

HERBERT PORTER.

#### Two Easily-made and Useful Tools.

Sir,—I enclose two sketches of tools which might be of interest to readers, as they are easily made and very effective. I have a 3½ h.p. twin N.U.T., and the valve springs are rather strong. It is also awkward to handle these with a screwdriver and take out the cotter pins, so I made the tool shown in fig. 1.

A is a piece of flat steel, bent at one end to hang on the pins of the cylinder. Four holes are drilled through which to put the bar B. This is made of ½ in. steel, split at the end, and then flattened. The valve caps require taking out, and a piece of wood put on top of the valve, and the cap screwed down with the fingers. This prevents the valve lifting when raising the spring.

Fig. 2 is a scraper for removing the carbon deposit. A is a piece of tube ¼ in. inside bore. B is a piece of tool or spring steel, ¼ in. diameter, knocked into tube A. The end is flattened out and bent. It is then ground up and hardened. Care should be taken in using this tool to get just at the edge of the carbon deposit, and, pressing the tool on the opposite side, press down. By just drawing the tool across the top of the cylinder the deposit is removed. All the carbon can be removed from a Triumph cylinder and piston in less than ten minutes.

G. WILKINSON.

#### An Inadmissible Theory.

Sir,—I should like the opinion of those who have studied the two-stroke engine in regard to the following theory:

In a two-stroke the exhaust port opens slightly in advance of the transfer passage. At this moment, the expanding charge, seeking the path of least resistance, commences to flow out of the cylinder, being assisted by compression within. When the transfer passage is fully open the exhaust port is open to the atmosphere. The burnt gases, in virtue of their initial expansion, tend to leave the cylinder, and, being of greater density, collect nearest the exhaust port. On the other hand, the incoming charge, being least in density, will rise to the top of the cylinder. The exploded charge falls to the bottom and leaves via the exhaust pipe. Thus, when the piston commences to rise, the burnt gas retained in the cylinder should be of a negligible quantity.

IGNORAMUS.

#### SUMMARY OF CORRESPONDENCE.

"A FEW FRIENDS."—We thank the writers of this letter for bringing the matter in question to our notice.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing 'legal' questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Oil Leakage.

**?** My trouble is oil thrown out around the pulley, and after about fifty miles my left leg, the whole machine, and, worst of all, the belt are smothered in lubricant. I had the engine recently overhauled, but still the trouble is worse. Is it due to over-oiling—I give one pumpful every six miles—or is it bearing trouble? There appears to be nothing wrong, such as excessive play, in any bearing.—W.D.S.

We should say that the trouble is likely to be due to the release valve not working properly; it might be as well to fit an extra release valve. Either there is too much crank case compression, or the main bearing on the pulley side is badly worn. A pumpful every six miles is a little too much perhaps; try half a pumpful every five miles. Fitting a felt washer behind the pulley might help matters a little.

### Worn Main Bearings.

**?** I should be glad if you would enable me to discover the cause of excessive wear in the crankshaft bearing (pulley side) of my  $\frac{3}{4}$  h.p. motor cycle. Three times within a year the engine has developed a very pronounced rumbling noise, and each time the inner surface of the outer ring of the bearing was found to be badly worn, and I am at a loss to trace the cause of this. Is the inner ring supposed to be a tight fit for the crankshaft, or should the latter slip through quite freely, and, if so, is there no tendency for the shaft to revolve in the inner ring? What is the best method of removing the timing gear cover screws? These are exceedingly tight, and a screwdriver cannot get a proper hold.—E.M.C.

The excessive wear you speak of must be caused by one or other of the following: Faulty bearings, insufficient lubrication, incorrect alignment of crankshaft, or belt run too tightly. Yes; the bearing should be a tight fit both in the crank case, and also fairly tight on the shaft. The only way to remove these screws is with a screwdriver, which should fit the slot exactly. If the slot in the screw head is worn or burred you should try to improve it by cutting it deeper with a hack-saw or small file. See that the screwdriver is sharp. Tapping it home into the screw slot will help to give a good hold. If the screwdriver cannot then be turned, assistance with a spanner gripping the flattened part of the screwdriver will probably help matters.

### White Metal Bearings.

**?** I have taken down my  $\frac{3}{4}$  h.p. single 1914 model after two years' use on account of a slight engine knock. I find the crank pin badly worn; the bush is in slightly better condition. I have sent away for a new crank pin, and contemplate turning out a new gunmetal bush and filling it partially with white-metal, a bush of this description being, of course, fitted rather tightly till the white-metal takes on a skin. What is the disadvantage of a white-metal big end? It gives satisfaction in cars, and I do not see why white-metal running on hardened steel and properly lubricated should not give at least as good satisfaction as gunmetal on a bicycle. I have always over-lubricated, and yet after 4,000 miles with a sidecar there is from  $\frac{1}{4}$  in. to  $\frac{1}{2}$  in. play on the big end, and with the hard bronze bush fitted the hardened steel seems to show signs of wear first. Admitting, of course, that the bushes fitted to motor cycle engines are far too small, white-metal seems to me preferable in many ways. I would be glad of your advice on the matter.—J.I.C.

There is no reason why a white-metal lined bearing should not be quite satisfactory; but we fancy that, owing to the small bearing dimensions and the greater speed at which they work, also the higher temperature and less efficient

lubricating system, you would not get the same results on a motor cycle with white-metal as on cars. We are inclined to think, unless you are anxious to experiment, that it would be more satisfactory for you to rebush your engine with phosphor-bronze. However, if you decide to try the experiment, you should run the white-metal into the bush, having first thoroughly cleaned it. The metal should then be scraped away until the bush exactly fits the crank pin. This is a ticklish job, and requires considerable skill.

### Difficult Starting.

**?** I am running a  $2\frac{3}{4}$  h.p. J.A.P., which gets away from cold quite easily; but at times, after running, it refuses to start up again without a great deal of trouble. It cannot be overheating, because it is just the same after five minutes or two hours. I have run the machine for sixty miles non-stop, and had not the slightest trouble, and yet I am afraid to stop in the middle of a run in case I cannot get started again. Can you suggest any reason for this? The spark is all right, as I can still get a shock off the terminal of the plug.—F.G.F.

Possibly you have too large a jet. Have you tried starting with the air a little way opened, as when the engine is warm the mixture may be too strong with the air fully closed?

### TESTING A MILITARY MOTOR CYCLE ON SALISBURY PLAIN.

If a motor cycle were human we should sympathise with those used for military purposes. Before they actually get to any war zone they are passing from one test to another. The usual manufacturers' test is followed by one made by the military authorities when each machine is handed over to them. This in some cases is followed by a buck-jumping test (!) as shown above.

**Magneto Breakdown.**

Q

My 6 h.p. machine held me up the other day and absolutely refused to start. The trouble was traced to a very weak or absent spark from the magneto. I proceeded to push the machine home, but got it to fire again after coasting down a very steep hill in gear. It continued to fire and carried me home, but has now failed again. My repairers have taken the magneto to pieces, but can make nothing of it, and it has now been sent to London for overhaul. (1.) Can you tell me what is likely to be the trouble? (2.) Would the high-tension wire slipping off the front cylinder plug while the engine was running cause damage to the magneto? This happened, and the spark was so strong that it fired the rubber of a Bowden cable.—R.H.C.

(1.) There are numerous things which happen to a magneto, such as the breaking down of the armature winding, a cracked brush holder, a broken carbon brush, etc. (2.) If the engine were running very fast when the plug terminal fell off this would impose a large strain upon the armature winding, which, however, should be saved by the safety spark gap with which every magneto is provided, though in your case it may have been adjusted with too wide a gap, and so have caused the current to burn the insulation of the armature winding.

**Variable Jet Carburetter.**

Q

The carburetter fitted to my machine seems to be extravagant in petrol. I have not had the machine long enough yet to know what it should consume or check it as to miles done per gallon. The description is as follows. In place of the jet tube there are two small holes in the bottom. There is a spindle which has a head that is not a true circle, and which can be turned with a small handle under the spraying chamber, so covering and uncovering the two small holes. Please state use of this arrangement. When I bought this cycle I found these two holes fully opened. Would that cause excessive petrol consumption, as it appears to me the diagrams of other carburetters only show one hole in jet? A pipe about 4in. long has been soldered on. Would this be better if it were lengthened out and bent round to face cylinder, so as to draw warm air into mixing chamber instead of cold, and should there be a piece of gauze in this tube?—F.J.

Your carburetter is a variable jet B. and B., the two small holes covered and uncovered by the eccentric disc being the jets. You should always run with these holes as much covered up by the disc as possible to obtain the greatest economy. If you have been running with them wide open, then you would probably be using too much petrol. Yes, draw the air from the warm cylinder in preference, but not if it means fitting a pipe with a very acute

bend in it. A gauze in this air pipe is unnecessary, and unless it is possible to make it so as to cover a very large area it is undesirable.

**A STAND IMPROVEMENT.**

On the latest model Pope the stand has a secondary member. When raising the back wheel on to the stand proper the support is first of all dropped down; foot pressure is then applied to the stand, which, acting as a lever, lifts the rear wheel easily and without any exertion on the driver's part.

**READER'S REPLY.****A Worn Timing Gear.**

Having read of "H.W.'s" troubles re magneto timing, I think this experience of mine may be of some help. Some time ago I took my 6 h.p. Bradbury to pieces for a thorough overhauling. After putting together, timing, etc., I went off for a trial. It started in about five yards. I jumped on. In fifty yards it stopped, and a restart proved impossible. I requisitioned the help of a passer-by. After hard pushing for about sixty yards a loud explosion took place, with fire coming through the silencer and exhaust pipe, behind which my good Samaritan had almost placed himself. For a second he thought his leg was blown off, and went away, refusing all further assistance with such a dangerous affair. I pushed the machine home again, went over the timing, which was all wrong, though I felt certain I had done the work well before. Off again. This time I was more successful. It went up the road, almost round the square, a quarter of a mile in all. I was "shaking hands with myself" when it suddenly stopped, and once again refused to budge. This was certainly funny. Anyway, no amount of coaxing would make it go further, and I had perforce to push the rest of the way home. I retried the timing—all wrong again. The two sprocket wheels were tight, all seemed right, and I was really puzzled. To reset it again and go off was only fooling and wasting time. I took off the magneto, looked at magneto chain driving wheels, and found all correct. Then I took the magneto to pieces, and only on reputting the same together did I find the cause of the trouble. Behind the contact breaker there is, or was, a small pin fitting in a hole on the armature. This had become bent, through

what cause I cannot tell, as the magneto had never been touched. The contact breaker was slipping on the armature, and the timing was thereby badly upset, of course. I put a new pin in, retimed, and my trouble was ended. I do not know if this is an unusual occurrence. I should think and hope it is, but it may also be the cause of "H.W.'s" trouble. Anyway, he can but make certain.—E. TAVERNIER.

Our stock includes Light Cars and Motor Cycles, both New and Second-hand. It is constantly changing, as the reputation of Godfrey's for straight deals means ready sales. If you cannot call, may we send you detailed Lists?

We will make you a liberal allowance on your old mount (provided it comes up to Godfrey's standard) against the purchase of either a new or second-hand machine—and, if you do not want to disturb capital, you can purchase by deferred payments.

**MATCHLESS, 1914, 8h.p. M.A.G. engine**, 3 speeds, fitted with Collier's special sidecar and Lucas dynamo lighting outfit with 3 lamps, Watford speedometer, excellent order; £82.—Maudes' Motor Mart, 100 and 136, Gt. Portland St., London, W. Tel.: 552 Mayfair. [5884]

**MATCHLESS Combination, 1914-1915, 7h.p. M.A.G. engine**, 3-speed countershaft gear, speedometer, lamps, new Palmer cord tyres, screen, etc., almost new condition, total mileage 4,000, the Rolls-Royce of motor cycles; great bargain, 65 gns.; another machine considered in part.—Longman, King St., Acton. Phone: 1578 Chiswick. [6012]

## Minerva.

**3½ h.p. Minerva**, m.o.v., mag., 2-speed; £10.—Edwards, 22, Daves St., Bolton. [5983]

**3½ h.p. Minerva**, re-bushed, mag., T.T. bars; bargain, £2.—55, Wolsey Av., Walthamstow. [5977]

**3 h.p. Minerva**, B.B., good tyres, good running order; £6, offer.—585, York Rd., Wandsworth. [6076]

**MINERVA, 3½ h.p.**, adjustable pulley, B.B., m.o.i.v., perfect; £4/15.—Aldelene, Offington Lane, Wrotham. [6088]

**MINERVA, 2h.p.**, faultless, low, wants tuning; first £3 secures.—Barfield, 7, Fairfax Rd., Hampton Wick. [X0779]

**MINERVA, 2½ h.p.**, side by side valves, mag. ignition, really excellent condition, smart appearance; £8/10.—Longman, King St., Acton. [6014]

**MINERVA, 3½ h.p.**, Bosch mag., in splendid condition throughout, including enamel and plate; £13/13.—Egbert Spearman, Bishop's Stortford. [5606]

## Moto-Reve.

**MOTO-REVE, 2½ h.p.**, mag., Druids, Amac, re-enamelled, goes fine; £2.—Desoutter, 4, Hanover St., London, W. [6211]

## Motosacoche.

**MOTOSACOCHE, 2½ h.p.**, quite new, variable gear, Druids; best offer.—46, Hanover St., Islington, N. [6172]

**3½ h.p. M.A.G. Engine** Motosacoche, Enfield 2-speed gear, 1913; 27 gns.—Troward, Heathurst, Vale of Health, Hampstead. [6105]

**1913 3½ h.p. Twin Motosacoche**, all chain drive, Enfield gear, Brooks B170, semi T.T. bars, lamp, horn, tools, etc.; owner serving; given away at £25, no offers.—Box L1,480, c/o The Motor Cycle. [6023]

## New Hudson.

**NEW Hudson, 3½ h.p.**, 3-speed, coach sidecar, 1913; 30 gns.—Troward, Heathurst, Vale of Health, Hampstead. [6106]

**1915 New Hudson, 2-stroke, 2-speed**, lamps, horn, etc., in good condition; £30.—Hilton, Sharp, and Co., Ltd., Foxhall Sq., Blackpool. [X9817]

**NEW Hudson, 2-stroke**, lamps, tools, 1915 model, splendid condition, small mileage; £22.—Elkins, 50, Conyers Rd., Streatham, London. [X0563]

**NEW Hudson 2-stroke** Lightweight, special Dunlops, Miller head set, panniers, etc.; £22, as new.—33, Cadogan Terrace, Victoria Park, London. [6100]

**1913 3½ h.p. New Hudson, Armstrong 3-speed**, all perfect order, excellent condition, £22/10; coachbuilt sidecar, cost 12 gns., £4/10; must clear.—Elsha, Selsey, Sussex. [6214]

**LATE 1913 4h.p. New Hudson Combination**, 3-speed, clutch, kick starter, coachbuilt sidecar, nearly new tyres, beautiful condition throughout, had little use; any trial or expert examination; sacrifice £40.—Grutton, Dimple Store, Matlock. [X0877]

## New Imperial.

**NEW Imperial, latest model**, in stock; no waiting.—Rose, Imperial Agent, Uxbridge. [6125]

**NEW Imperial, 1915, 2-speed**; 24 gns.—Troward, Heathurst, Vale of Health, Hampstead. [6107]

## MOTOR CYCLES FOR SALE.

## New Imperial.

**COLMORE Depots, Manchester and Leicester**, for immediate delivery of New Imperial motor cycles. [X0805]

**IMPERIAL-J.A.P., 1916, latest model**, 2-speed, in stock; £32.—Layton's Garage, Bicester, Oxon. [X1004]

**NEW Imperial, 2-speed**, variable ignition; £25.—Doctor, 387, London Rd., Thornton Heath. [6067]

**NEW Imperial, light tourist**, immediate delivery; cash or easy terms.—Referee Cycle Co., 332, High Holborn. [6076]

**1916 2½ h.p. New Imperial-Jap, 2-speeder**, only 10 days old, perfect; £34/10.—Crow Bros., Guildford. [5091]

**NEW Imperials, latest models in stock**; 2-speed, also kick-starter hand-controlled clutch models.—P. J. Evans, John Bright St., Birmingham. [X1024]

**IMPERIAL-J.A.P., 2½ h.p., 2-speed, clutch**, and kick starter, with Moto-Gum sidecar, all new April, 1916; £45.—Ling, South Ockendon, Essex. [X0814]

**NEW Imperial-Japs, latest 1916 models**, for immediate delivery from stock; £38; 2-speed countershaft gear and free engine; exchange or extended payments.—Wanchope's, 9, Shoe Lane, Fleet St., London. [6188]

## New Ryder.

**NEW Ryder-Jap, 1915, 2-speed**, new December; 25 gns.—Troward, Heathurst, Vale of Health, Hampstead. [6108]

**NEW Ryder-Jap, late 1915, 2 speeds**, lamps, generator, horn, and tools, like new; £27/10.—Earl, 5, Heath St., Hampstead. [6073]

**1914 (used six times) New Ryder, 2½ h.p., 2-speed**, rear light, Miller lamp, horn, 25 gns.; portable shed. £2.—7, Wrotham Rd., Gravesend. [6021]

## N.S.U.

**N.S.U., 3½ h.p.**, spring forks, mag., F.E. clutch, Empire de Luxe saddle, B. and B. carburetter; £10, cheap.—60, Alma Rd., Peterborough. [X0875]

**N.S.U. 1914 Twin, 3½ h.p., 2-speed**, mechanical lubricator, £25; also sidecar, £5, torpedo, coachbuilt.—J. Ormand, Beelsby, Grimsby. [X0826]

## O.K.

**O.K., 2-stroke, 2-speed, 1915**, shop-soiled; £26/10.—Mundy, Somerton, Somerset. [6204]

**O.K. Junior, 2-speed, 1915**, been 500 miles; take £25.—65a, Rosendale Rd., West Dulwich. [6158]

**O.K., 1915 (May), 2-stroke, 2½ h.p., 2-speed**, unscratched, as new, complete lamp, horn; bargain, £26.—Withers, Wisemore St., Walsall. [X0760]

**O.K., complete with lamps, horn, tools**, cost £37/10 new last October, will take £22; 2½ h.p., 2-speed, only done 800 miles.—Lieut. Stock, R.M. Barracks, Chatham. [5978]

**If You Are Requiring a really good lightweight 4-stroke**, what's wrong with the latest O.K.'s at reduced prices? Mark IV., J.A.P. engine, 2 speeds, £36; Mark VI., M.A.G. engine, 2½ h.p., 2 speeds, £40. Exchanges arranged.—Maudes' Motor Mart, 100 and 136, Gt. Portland St., London, W. Tel.: 552 Mayfair. [5889]

## P. and M.

**P. and M., 3½ h.p., 2-speed gear**, mag.; must sell; £10.—9, Waldegrave Rd., Teddington. [6175]

**P. and M., 3½ h.p., 2 speeds**, and coachbuilt sidecar, fully equipped and in lovely condition; £29/10.—Crow Bros., Guildford. [5090]

**1914 3½ h.p. P. and M., 2-speed**, wicker sidecar, in perfect condition; cash or easy terms; £24.—R. E. Jones (Garages), Ltd., Swansea. [6072]

**1914 P. and M. and Corvette Coachbuilt Sidecar**, in excellent condition; not done 300 miles, many spares; £70.—Box L1,487, c/o The Motor Cycle. [6235]

**1915 P. and M., with 11 gn. sidecar**, fitted wind screen, large P. and H. lamps, spare tyre, unriden since August; bargain, £57/10.—Sutcliffe, Willow Gardens, Halifax. [X0931]

**P. and M., 3½ h.p., 1913 model**, kick start, 2 speeds, excellent condition, and will take a sidecar anywhere; £35.—Maudes' Motor Mart, 100 and 136, Gt. Portland St., London, W. Tel.: 552 Mayfair. [5885]

**P. and M. Twin, 1915**, fitted with luxuriously appointed Gloria sidecar, in absolutely new condition in every way, the most perfect motor cycle on the road, as per illustration in "The Motor Cycle" issue 11th; a bargain, £95.—Embryo Cycle and Motor Co., Charlotte St., Hull. [5967]

## Peugeot.

**7 h.p. Peugeot, 2-speed**, in splendid condition, with pillion seat, coach sidecar; price £28.—10, Ada Rd., Brunswick Sq., Camberwell, S.E. [6251]

## Precision.

**2 1/2 h.p. Precision-Torpedo, 2-speed**; free; £24; exchange combination.—Brett, Masingham, Lynn. [6131]

## Premier.

**PREMIER, 1913, 3½ h.p.**, footboards, good reliable machine, take sidecar, good tyres and belt; £20.—Lee, Nichols St., Leicester. [X0550]

**PREMIER, 3½ h.p., T.T. engine**, Binks carburetter, in splendid condition; for quick sale £24, or near offer.—101, Tooting Bec Rd., S.W. [6087]

## Export Difficulties.

**L**AST March we devoted considerable space to the difficulties with which manufacturers of motor cycles had to contend in the transport of goods and the delay in shipment as well as the delay in obtaining licences to ship abroad. It will be recalled that we invited the opinions of different manufacturers, and that the evidence forthcoming was by no means a compliment to the Board of Trade, even acknowledging the difficulties with which the authorities are confronted. The correspondence in question, as received from the different makers, was submitted to the Board of Trade on the 17th March last, and a reply is now forthcoming as under:

"With further reference to your letter of the 17th March, regarding difficulties experienced by exporters of motor cycles, sidecars, and accessories, I am directed by the Board of Trade to state that they understand from the War Trade Department that the delay in connection with Messrs. Hobart Bird's applications for licences was due to the fact that enquiries had to be made regarding the consignees, but that certain of the licences have now been issued. The delay in the case of the Sun Cycle Co.'s application was due to the special arrangements that have to be made for Swedish traffic.

"With regard to the railway difficulties referred to in the enclosure to your letter, I am to say that the railway companies are not in a position to forward goods until they are informed by the dock authorities or shipowners that the vessels by which the goods are to be shipped are able to accept them."

## Expert View of the Machine Gun Sidecar.

**I**T is but a few weeks ago that we discussed the question of armoured cars *v.* armoured sidecars, enumerating the advantages of each type. We made no pronounced claim for either so far as the suppression of the opposite type was concerned, our considered opinion pointing rather to the good uses and possibilities of both types. Where the armoured

car scores is in the adequacy of the protection which can be provided for the occupants. The sidecar, on the other hand, carries no real protection, but in some respects is no worse for that, as it is rendered much less obtrusive. It is thus able to steal nearer to the points of action without observation. Another strong point in favour of the gun-mounted sidecar which we pointed out was the comparatively small amount of room that such a vehicle occupies on the road. This is a most important consideration. One is permitted to discuss in this wise the advantages of the armoured sidecar and armoured car, as up to the present trench warfare has deprived either type of showing up its capabilities in the real field of operations, but the time will assuredly come. In this connection it is interesting to quote the undermentioned extract from a personal letter by a member of the staff of General Joffre published in *The New York Tribune*. This letter says:

"The motor cycle armed with a small mitrailleuse such as we now employ is much more useful than the armoured motor car. It is very small. One can come very near to the enemy without being seen. One can hide behind trees bordering the road, make an attack upon an advance guard, and get away quickly and safely. If the road is bad one can take the muddy sides and avoid the big holes, which are disastrous for heavy carriages. One clever rider and good shot can do great harm in a few minutes. As soon as he arrives at the place from which he wishes to attack he can put his mitrailleuse in position and destroy a patrol, or a convoy, or even an advance guard, and speed back to his own lines at eighty kilometres an hour. He can change his position so often and so quickly that the enemy's detachment cannot find his firing position. In the country he offers only a very small target compared with the big side of a steel-covered motor car.

"Three of our cycle mitrailleuse accomplished the other day a wonderful raid. They heard that a German regiment was going to enter, music ahead, a village. They arrived in front of the column and hid behind bushes. As the first ranks of the Germans entered our three men fanned them with the motor cycle guns. Every man in the German regiment was not only wounded, but killed."

## KINKY BILL.

D'yer see that motor bike just there? That's Kinky Bill—my 'bus—  
A most astoundin' blighter, an amazin' sorter cuss,  
'Oo makes them pore deluded fellers from the trenches larf,  
But when they've got to pad their bloomin' 'oof I smiles,  
not 'arf.

Why do I call 'im Kinky Bill? It 'appened just like this,  
'E got 'is kinks through playin' at a game called "'It or Miss,"  
A black Maria didn't miss nor yet exactly 'it,  
But put old Kinky William out of action for a bit.

I sat down by the roadside and I did the best I could  
To stick the bits together same as anybody would;  
Our mud 'eap wasn't 'ealthy; the despatch was urgent too,  
So I ses to Kinky William, "It's the Push, me lad, for you."

With that I swung me leg across an' kicked till all was blue,  
But not a grunt. "That Push," I ses, "is meant for me,  
not you."  
So off I 'opped and shoved, and then, just when I'd got  
the pip,  
That lop-eared engine started, and we didn't 'arf let rip.

'E ditched me five or six times, all the same we 'ummed  
along  
Until I sees some pavvy, when 'is Kinks was goin' strong,  
Outside a little village where the 'Uns 'ad got the range,  
And after miles of slush I thought the pavvy'd be a change.

"That lop-eared engine started, and we didn't 'arf let rip."

It was—a lightnin' change. Ole Kinky did a record slide,  
And, waltzin' to the deepest ditch in all the countryside,  
Skidded orf the bloomin' map, 'e did—and dropped me  
fairly in  
To twenty feet of water, but I guess that saved me skin.

"Skidded orf the bloomin' map, 'e did—and dropped me  
fairly in  
To twenty feet of water, but I guess that saved me skin."

For as I landed on me 'ead I 'eard a mighty bump—  
About a ton of 'ate came down and busted with a crump—  
And if I'd bin on top there—well, I *wouldn't* be there,  
see?

But my ole 'bus 'ad found a trench to shelter 'im and me.

So I ses, "Tippit," ducks me 'ead, and sits tight through  
it all,  
A-thinkin' of what might 'ave been but for that lucky fall;  
And when the 'Uns stopped stravin' sorter crawled out  
ginger like,  
Both drippin' wet but still thumbs up, me and the motor  
bike.

Now ain't it reel intelligent the 'uman kinder way  
That 'arf-cock jigger saved me life and brought me 'ome  
all gay?

It is, and it don't worry me what any feller thinks,  
Because I don't forget the day when Kinky got 'is kinks.

—W. W. ABBOTT.

## MUD BLISTERS.

**D**URING wet weather tyres are particularly susceptible to an ailment known as "mud blisters," which, if neglected in the early stages, will make themselves felt later on, and are just as much calculated to ruin a new tyre as an old one.

Mud blisters are caused, in the first place, by a small cut in the tread. Moisture works into the cut, and is forced towards the edge of the tyre, gradually separating the rubber from the canvas in that direction. In the cavity thus formed grit and mud accumulate, slowly forming a large hard lump of solid dirt at the edge of the tread between the canvas and the rubber covering.

If a blister of this kind is not noticed till it has attained a considerable size, I think the best plan is to attend as effectively as possible to the cut and leave the blister alone. For should one cut it, the tension causes the rubber to split for the entire length of the gathering, with the result that an ugly and almost irreparable gash is formed.

As a rule, these gatherings are noticed in the early stages, however, when they should be attended to immediately. Make a small longitudinal cut at the edge of the blister and as far from the tread as possible with a sharp penknife, and carefully scrape out all accumulated grit, finally scrubbing inside and out with an old tooth-brush, attending to the original cut in the same way. The latter can then be repaired with "Filcut" or some other suitable preparation, but the insertion at the edge of the tread will probably require rather different treatment. If it is sufficient distance from the tread, and if the cover is of good quality rubber, I have found the best repair is effected by carefully covering the defect with a "Patchquick" patch, which will wear indefinitely, so long as it is not actually in contact with the road.

Prevention is a great deal better than cure, however, and during wet weather the treads of tyres should be regularly examined for cuts, and attended to accordingly. B.

# Occasional Comments

by "Ixion"

## Watch for Leaks.

The petrol system has taught many of us that few motor bicycles are free from petrol leaks; the green tinge of the mixture soon shows where the leak occurs, and then we begin to learn how difficult it is to find a petrol tap which is leak-proof. With No. 1 spirit at 2s. 6d. nobody likes leaks, and I advise my readers to dye a tankful of spirit, and see whether all their consumption is genuinely passing through the engine. I do not know of any objection to dyeing a gallon of spirit with a penny packet of aniline dye, but anyhow a very slight admixture of engine oil will serve to colour the spirit and betray unsuspected leaks.

## Testing Heavy Fuels.

Like most motor cyclists I am busy experimenting with heavy fuels, ranging from the petrol-paraffin mixture to special substitutes lighter than paraffin. In such work one really needs an auxiliary tank to hold pure petrol for starting and warming up purposes, nor are such tanks dear to buy. Still, I do not use them, because they necessitate coupling up a double supply pipe with a two-way tap, and if the tests cover more than one machine, the necessary alterations imply a lot of fiddling work with a soldering iron, and dearly as I love my handy little Tinol outfit, I dislike interfering with a petrol system which isn't leaking anywhere. So I have two dodges which eliminate the spare tank. If the fuel I am using has already been proved usable, I fill the main tank with it, and carry a little leather holster holding a fat petrol can containing a gill or so of pure spirit. Then I always stop the engine by turning off the tap of the main tank, and when a restart is due, slip off the cover of the float chamber and fill it by hand with petrol.

## Vaporising Heavy Fuels.

So far as my rough and ready tests go, two minor points are essential to ensuring good vaporisation of a heavy fuel. The one is a hot air supply, the other is a fine jet. It is astonishing what results one can get out of heavy specific gravities if these essentials are arranged; a mixture of one-third paraffin with two-thirds petrol behaves quite decently. The hot air supply is not difficult to fake up; if the necessary metal work baffles an amateur mechanic, rubber hose of the type used on car water-cooling systems will make elbow joints with the minimum of trouble, and so enable the least promising air intake to be hitched on to the cylinder walls or the exhaust pipe. The fine jet is more tiresome, but equally essential. The Binks three-jet carburetter should be immensely popular for this purpose, as it will atomise almost anything. Failing a Binks, there are carburetters which possess extra atomising appliances placed over a single jet; and, failing these, there are inexpensive fitments, e.g., the Terry jet cover, which all help to break up a liquid spirit emerging from the standard single orifice jet. The numerous riders who are try-

ing to keep down their fuel bills should keep these two principles in mind, viz., that heat and fine jet orifices are sure to be their principal needs.

## Caught Napping.

I was tempted by the fine weather this week into venturing out on a short trip in my walking clothes. Being a canny chiel, my spanner and spare sparking plug always repose in the side pocket of my driving jacket, and were therefore left at home. Before long I got down into a dip, out of which two roads emerged, both including a very decent stretch of 1 in 5 gradient. The sparking plug of the back cylinder chose this moment to soot up, and I made the horrifying discovery that I had no spanner. Fortunately, my low gear was very low indeed; so I made a rush at one of the hills on one cylinder, and made a clean ascent. This little incident indicates the progress British motor cycles are making. Not long ago—to be precise, in the A.C.U. Six Days of 1911—a 1 in 5 hill was regarded as a goodish test for a crack rider mounted on a perfectly tuned jigger. To-day, one can take such a hill on the front cylinder of a 3½ h.p. twin, thanks to the low emergency gear provided. I should add that the total length of the hill in question is one and a half miles, though the single figure gradient does not exceed 200 yards.

## An Unsolved Problem.

The machine above referred to was a horizontal twin, and it is a curious thing that though this type of engine has now been many years on the market, none of its devotees have quite solved the problem of equalising the lubrication of the two cylinders, which strikes an ignoramus like myself as a far simpler problem than it is with the V twin. Oiling is all but even nowadays on the best V twins, but though I believe I have owned every known make of horizontal twin, I always turn instinctively to their rear sparking plugs, when a cylinder chips out, and I am very seldom disappointed. An optimist would, of course, say that one of the great merits of the "flat" twin is that you always know which plug to clean when misfiring begins; but at the risk of being termed cynical, I will emphasise the fact that even oiling is more vital to the horizontal twin than to the V. A V twin has no particular balance to boast of, even when it is in the pink, and a little extra disturbance of the balance doesn't matter very specially. But a good horizontal twin has a very decent balance indeed when it is in perfect order, and uneven oiling means much more than the risk of periodically sooted plugs. It means that the valves of the back cylinder get foul sooner than their forward brethren, and that the carbon deposits astern are the more rapid and the heavier. Both of these factors impair balance. Therefore it is eminently desirable that Messrs. Douglas, Brough, Bradshaw and Co., should work out a perfectly even oiling system for their delightful engines as soon as possible.

## A MODERNISED MOTOR TRICYCLE.

Some Ingenious Ideas of an Enthusiastic Amateur Mechanic.

IN view of the recent remarks made by our contributor "Ixion," concerning the lack of initiative shown by manufacturers in designing an up-to-date motor tricycle, the following description of a three-wheeled vehicle, built from parts of an old tricycle by Mr. Leonard Jones, Glenfern, Alexandra Road, North Finchley, N.W., will undoubtedly be of interest. Mr. Jones is a most enthusiastic and exceedingly skilled amateur mechanic, who, moreover, has had great experience with three-wheeled motor vehicles. His name first came into prominence before readers of *The Motor Cycle* in June, 1903, but it was on June 27th of that year that he first made his *début* as a competition rider. This was in the famous 200 miles reliability trial organised by the M.C.C. for the S. F. Edge trophy. Previous to holding the competition, the following comment on the trial appeared in *The Motor Cycle*: "The 200 miles trial, as practically all motor cyclists know, is a test of both man and machine, as only a thoroughly seasoned and skilful rider can accomplish it without some involuntary stops, however good his machine may be. It not only means smartness and ready resource on the road, but a careful preparation of the cycle before the start, and, last but not least, some little physical endurance." How true those words were only those who can call to mind the unreliability of the

AN OLD  
THREE-WHEELER  
BROUGHT UP TO DATE  
BY A KEEN AND  
CAPABLE AMATEUR.

motor cycles of those days can fully realise. There is little doubt that when Mr. S. F. Edge gave the cup he expected it would be won outright on the first day, but there were four consecutive rounds before the contest was decided. In three of these Mr. Jones made a non-stop run on his  $1\frac{3}{4}$  h.p. De Dion tricycle, which was the smallest engine entered, and covered altogether 750 miles without experiencing trouble. What was to have been the final was spoilt by Cowles, Jones, and Milligan making non-stop runs. Then came the postponed final on November 7th, a Saturday. Cowles was disqualified because a screw on his luggage carrier shook loose, but the two other invincibles, Jones and Milligan, made non-stop runs. The trial was continued on the Monday, when the wonderful tricycle was thrown out of commission through a

(Upper) General view of the tricycle, with Mr. Leonard Jones at the wheel.

(Lower) Engine and transmission. This should be studied in conjunction with the diagram on page 533.

puncture on a patch of new metal near Hockliffe, leaving Milligan, the Bradbury rider, the winner. In this event any sort of stop was counted against the competitor.

Practically every part of this machine, except such fittings as engine, back axle, and those parts which are obviously the products of the factory, has been manufactured by Mr. Jones in his own workshop, the interior of which we illustrate. As will be noticed, the lathe is power driven, the motive

**A Modernised Motor Tricycle.—**

power being a 2-h.p. water-cooled Iris engine. Now the Iris, a French machine, was one of the first motor bicycles in this country which had a water-cooled power plant. Mr. Jones was exceptionally lucky in having picked it up for the sum of 30s. He did a good deal of work to it, fitting it with a mechanically-operated inlet valve, magneto ignition, and so on. This is one of the few motor cycle engines we know of running on coal gas. The gas bag is made out of a football bladder, while the Brown and Barlow carburetter, which was specially adapted, forms the mixing chamber. The float chamber is done away with, and underneath where the gas is introduced is a small suction valve through which the gas is drawn into the engine. The throttle is retained, but the extra air inlet has been blocked up, the air supply, which is adjustable, being immediately below the admission valve.

Front wheel, showing steering arrangements.

**Three Engines—One Magneto.**

In addition to the tricycle, Mr. Jones has also an ingenious four-wheeler. For the three engines there is only one magneto, which is so attached that it can be instantly removed from the four-wheeler or the tricycle to the power plant. Though small, the workshop is exceedingly well equipped, and, having the necessary skill and knowledge, Mr. Jones is capable of doing practically all engineering work. A short reference was made to the tricycle in the issue of *The Motor Cycle* of September 18th, 1913, but this dealt more with its behaviour on the road than with its mechanical details.

**The Three-wheeler.**

The actual machine is built up largely of old De Dion parts—that is to say, the engine, back axle, and wheels are remnants of an old tricycle. The engine, however, has been rebored, and instead of being 75 mm. x 76 mm. is now 78 mm. x 76 mm. The transmission and gearing are both interesting and ingenious, and the accompanying diagrammatic drawing will show the manner in which the change of speed is effected. The drive is through a cone clutch and universal joint to a countershaft on which are mounted three sprockets. Of these the two nearer the engine are free on the shaft, but can be locked thereto by the intermediate dog clutches. The sprocket, however, on the extreme right is mounted on a free-wheel. All three sprockets that they drive on the countershaft are,

therefore, fixed solidly. When the dog clutch is in the centre, the low gear is in engagement, and the free-wheel clutch will come into operation as soon as the engine begins to drive, but in the event of the dog clutch being moved either to the left or right to engage either the second or top speeds the drive is taken on one of these sprockets, with the result that the large chain wheel on the countershaft causes the free-wheel to over-run. We therefore get an excellent three-speed with a minimum number of moving parts. The final drive is through a small sprocket on the extreme left of the countershaft by a heavy Renold chain to the sprocket on the back axle, which is provided with a spring drive, thus tending towards sweetness of transmission and prolonging the life of the chains. It is interesting to note that the outer member of the cone clutch is in two halves, so that it may be dismantled without interfering with the rest of the mechanism. An ingeniously contrived

universal joint is interposed between the engine shaft and its extension, thus making up for any variation in alignment due to torsional stresses. On the left of the engine is a box in which the magneto is contained. It is, therefore, completely enclosed, but is easily accessible, as the lid may be instantly removed, and the magneto taken out merely by undoing one nut.

The transmission is enclosed, a flexible leather covering enclosing the clutch and starting gear mechanism, while a sliding cover in the compartment on the right totally encloses the gears. Oil is contained in a tank on the right-hand side of the vehicle, and an oil pump conducts the lubricant through branch pipes, of which one goes to the hollow gearshaft, lubricating the transmission, a thin branch goes to the inclined plane which actuates the clutch and the shaft upon which it is mounted, while the remainder goes to the crank case. Furthermore, the crank case release is directed on to the main driving chains. The main solid axle of the vehicle is, as will be noticed, stayed by a kingpost arrangement above.

The frame has been entirely constructed by Mr. Jones. The top portion forms a complete triangle from the main axle to the head, and underneath to the centre of the live axle casing is a long curved tube, which is further triangularly stayed by tubes running from the end of the axle casing to a point halfway up the main central tube, while there is a further stay from the bottom of the engine crank case to the same tube. The body, also built by the owner,

has a shock absorber fitted beneath it in addition to being suspended on springs, and is made of Duralumin, that wonderfully light and tough material produced by Vickers-Maxim. The weight of the metal alone in the body only amounts to 6 lb. The engine is fitted with a special sparking plug of Mr. Jones's invention and construction.

**A Most Ingenious Speedometer.**

The neat adjustable celluloid wind-screen is worthy of attention, as is also the special speedometer, which, too, is the outcome of Mr. Jones's ingenuity. This is provided with a governor wheel eccentrically mounted, after the style of the ordinary Watford or Smith speedometer. These wheels are kept in position by a spring, and as the speed increases

so the wheel tends to assume a flatter position, and in doing so it actuates the lever arrangement, which in most speedometers is coupled up to the indicator hand.

This, however, is not the case with Mr. Jones's invention. The lever acts upon a series of aneroid vacuum boxes, which in this case are filled with a mixture of oil and glycerine. The pressure of the lever on these tends to cause the liquid to exude therefrom, and to travel up the pipe to a similar set of bellows in the instrument itself on the dash, which, in turn, work a lever which actuates the indicator hand. The amount of pressure imposed upon the boxes or bellows varies in direct proportion to the speed

of the vehicle, and consequently the liquid assumes the same functions as a flexible shaft, but with the advantage that there is nothing in it to wear.

A corner of Mr. Jones's workshop, showing the water-cooled motor cycle engine (on the left), the case containing the football bladder, and the lathe with the home-made screw-cutting attachment.

BY THE SIDE OF CLUNIE LOCH, PERTHSHIRE.

The photograph was taken on the occasion of the second run for wounded soldiers organised by Dundee motor cyclists. The guests numbered eighty-five, and a few are shown in the above group of twin-cylinder Enfield-Jap sidecar outfits.

## TWO-STROKE ENGINES.

### Some Impressions of a Doctor serving on the French Front.

HAVING been a constant reader of *The Motor Cycle*, which I receive even in the first line, the writer has followed with interest all that has been written on the two-stroke engine. This type of engine has always interested me, and, being the first French motor cyclist to possess a two-stroke (Scott), I am one of those who have praised the qualities of two-strokes applied to the motor cycle in French motor cycle papers. Having, therefore, studied two-stroke engines for a long time, I am tempted to put my impressions on paper.

First, it appears that one of the great inconveniences of two-stroke engines is the great quantity of heat which they develop, and which does not evaporate quickly enough in the air when the engine runs slowly. Consequently even when changing speed it is impossible to make the engine revolve at full power on an incline, since the displacement of air is too small to disperse the heat, and the engine overheating, the sparking plug becomes incandescent and the machine stops.

I am surprised that so few manufacturers have attempted to establish cooling at a standstill without having recourse to water cooling. Although in the case of the Scott I have noticed how infinitely superior this engine is to the type without water cooling, I believe this system is too heavy. In addition many cyclists are afraid of the radiator and of leakages.

#### Fan Cooling.

The gilled system of radiator, the Harcourt type, is very convenient, but there again displacement of air is necessary, and consequently it seems to me that it would be an advantage to fit two-stroke engines with ventilators worked by the engine itself. That would not present great difficulty, and besides one could completely close the engine and increase protection against mud without hindering cooling.

A ventilator would certainly be very efficient; trials have been made in France with perfect results. There would be something there to study, and I am sure that the practical English makers would arrive at a marvellous result.

From another point of view—the efficiency of the two-stroke—the great obstacle is the imperfect clearing out of the burnt gases, and the loss through the exhaust port of a part of the fresh gases. It seems to me that if the first quantities of compressed gas coming from the case were not explosive gases but pure air, this air would sweep out the cylinder better, and could escape by the exhaust without at all affecting the efficiency.

Some time ago [September 9th, 1915.—ED.] in *The Motor Cycle* there appeared a notice about an invention by the makers of the Paragon two-stroke engine, and at a low price. As I have not heard this system spoken of, I am recalling it, for it appeared good. It consists of putting upon the "transfer port" cover a valve to admit air, this valve being made by a piston rod with a limited stroke, and regulated by a screw. On the induction stroke the air entered by the valve, which was easily regulated in such a way that the transfer passage alone was filled. When the gases passed from the case to the cylinder, the first to enter was then pure air; this air swept away the burnt gases, cooled the cylinder, and served as a cushion between the burnt gases and the fresh gases, while preventing their mixture. It is evident that the regulation of the valve must vary with the speed of the engine, that is to say, pretty often, and it would be well to have a lever for this regulation at the handle-bar. It seems to me that this lever might have a great effect upon the control of the engine, and would allow of easy slowing down without fear of the unfortunate "four-stroking."

As soon as the war is finished I propose to try this system upon my new two-stroke. R. CAMUS.

#### A SIDECAR SCREEN REFINEMENT.

Canvas side flaps which, in conjunction with the scuttle and low glass screen, made the sidecar extremely comfortable and free from draughts. The outfit belongs to Mr. Jones, the Dundee Harley-Davidson agent; he is shown taking a wounded soldier for a run.

## MY DÉBUT ON A 7-9 h.p. SOLO.

### A TALE OF HILL-CLIMBING AND ADVENTURE.

By E. P. BURDETT,  
2nd Lt.

THE dog was the real reason why I bought the Harley-Davidson. Outside our camp is a nice little speed track, which is also, unfortunately, a main road. And that morning the powers that be, having previously warned us for the Front, had decided to send us to a certain detestable place whence escape is not for many months; but, relenting a moment, had granted us three days' leave before reporting. So there was every reason why I should be blinding down the road at a speed wholly out of comparison with the legal limit, on my tight little  $3\frac{1}{2}$  h.p. twin Matchless of uncertain age, to fill up with petrol at our favourite garage.

But love and war wait for no man. Whether it was love or war that controlled the antics of the two dogs concealed from my view by the cart at the side of the road I shall never know. But just as I drew level one of them sprang impetuously across the road, precisely into my front wheel.

I picked myself up about twenty yards on, having turned, I was informed by an eye-witness, and my own sensations confirmed, two complete somersaults in the air. I shook myself, miraculously undamaged. I limped to the spot where a crowd had collected round the heaving corpse: gathered that we were exonerated from blame: gathered that it was a prize dog, and somebody's only joy in life: and gathered that even the owners of the other mongrel wished it exterminated. The situation was beyond words, though not beyond tears on the part of many of the bystanders. I limped down to the garage and sent for the remains of the Matchless just in time to prevent the number being taken by a policeman.

#### The Deal.

After I had been bandaged up by the nearest doctor the position began to crystallise. The Matchless was intact ("some" frame), except that as we were somersaulting something had caught the rod of the hub gear, and yanked the gear suddenly into bottom, finally breaking the rod. At the speed we were going this had stripped half the pinions, and ghastly noises were audible from the hub. Consequently the bus was useless till parts had been obtained—and everyone knows what it is to get parts for Armstrong gears. Also, most insistent fact of all, I had three days' leave.

It is characteristic of great minds to make rapid decisions. There in the garage stood a great beast of a Harley-Davidson. I knew whose it was. S., one of my comrades-in-arms, had it for sale because he

was afraid of straining his heart in trying to start it. The garage proprietor wanted £55, but might take £50 cash. The Matchless was surely worth £35, even with the damaged hub. A rapid consideration of the situation at Cox's. "Would he take the Matchless and £20?"

With some persuasion he would. So I gave him a post-dated cheque, poor fellow, and left the tyres to be changed round, and most of the bolts holding the engine to the frame replaced.

Thus, at 10.15 next morning I started off to lunch with H. at an appointed hotel in Grasmere, which is eighty miles away. And it rained forty days and forty nights. At all events, all the way to Grasmere.

It was with some trepidation that I let in the clutch, as it was my first ride on any motor cycle of over 6 h.p., let alone solo on a wet day. However, I reflected that if I were killed I should certainly not go to the detestable place before referred to, which would be all to the good.

But T.T. bars and perfect balance soon give confidence, and I slushed through the mud at a speed which was never much below 30 m.p.h., for I regret to say that the untuned carburetter did *not* promise the 4 m.p.h. on top which we read about in the advertisements.

I paused for ten minutes in Preston in an unsuccessful attempt to buy sparking plugs, and then started on the fine stretch to Lancaster. In spite of the rain, this was in good condition: it is a road which never gets muddy. Then on to Kendal, which is a particularly greasy town in wet weather; and slowly, in fear of skids, on to Windermere and finally to Grasmere, where I arrived at five minutes to one—not too bad for a maiden ride. I found to my surprise that over this eighty miles I had used less than a gallon of petrol, which was just as well in view of the distinctly inferior tank capacity of the 1915 model; this, of course, has been improved in the 1916 tank.

#### Testing the Hill-climbing Powers.

H. rode a 1913 Rudge-Multi, and after lunch we set out to try our luck on the local test hills. Red Bank comes first on the list, and I had heard so much about the terrible gradient that I changed down to middle early on, as I had not thoroughly mastered the Harley gears, and dared not risk a sudden change down at the last moment. We sped up to the summit in fine style, and I could not help thinking that I could have done it on top, but on maturer reflection I doubt this. The Rudge got up all right in the end, but here and elsewhere was slowed by a slipping belt on low gear, due to a worn pulley.

We joined the Windermere road, and turned off at Ambleside for the Kirkstone Pass to Ullswater.

**My Debut on a 7-9 h.p. Solo.—**

There are two ways up Kirkstone; a comparatively easy way by Troutbeck from Windermere, and the steep ascent from Ambleside. The Harley again took the long gradient on middle, though we were all out in places, and I halted outside the Kirkstone Pass inn to watch the Rudge.

I never expected it to get up. But H. took the hairpin perfectly, and brought it up by very clever riding, moving the gear lever all the time to get a grip on the belt. The Rudge cylinder at the top was as cool as the Harley.

We went on to Ullswater, most beautiful of the lakes, and thence on to Penrith and Keswick, a splendid road all the way, and so back to our base at Grasmere, very well pleased with ourselves.

The next morning dawned fine, and we set out for Keswick, taking the prettier road to the left of Thirlmere. We left Keswick by Whinlatter Pass, past Derwentwater. The road surface here is terrible, and for the first time I used low gear in order to go slowly through the ruts. We turned off to the left at bottom, and rode past Crummock Water and Buttermere to the foot of the most famous hill of all—Honister.

**Up Honister Pass.**

The climb up Honister from Seatoller is a mere trifle to the Buttermere side. Nobody who wants long life from his tyres is advised to try the climb from Buttermere. The gradient is probably not much worse than Red Bank, and the length is not much greater, but the surface is entirely of loose pebbles, in which the wheels sink and cannot get a grip. I was climbing the hill on middle before I realised I had reached it. I came on the bad surface, and bungled the change down (on the Harley system the clutch must be taken right out before the gear lever can be moved). Before I had the gear in we were going backwards, and I only saved a fall by jamming on the brakes. The Rudge, better ridden, passed me, but soon came back again, and H. said that further on it was impossible.

However, I made a restart, and by throwing all my weight on the back wheel, climbed without much wheel slip to the steepest part, about a hundred yards from the summit. Here, on looking up, I saw an Arrol-Johnston coming down fairly fast with both back wheels skidding.

There was just room to run into the rock at the left-hand side, and the car just cleared me, the driver shouting out an apology as he passed. H. says the car got to the bottom in safety, but it must have taken good driving. When the car had passed I had to drop the Harley, which fell over sideways in the stones; but by and by two or three men came along and with vast exertions we lifted it and pointed it up the hill, and chocked the back wheel with an enormous stone. I

started the engine and let in the clutch very carefully. To my amazement the machine responded at once and moved up the hill, and we reached the top in style, amid cheers from the onlookers.

I rejoined the Rudge at the foot of the hill, and we went on to Cockermouth and back by Bassenthwaite Lake. On this trip the Harley averaged no less than 70 m.p.g.

**A Quick Return.**

All good things must come to an end, and next morning I set off back to camp. On the way misfiring began. The "Silent Grey" ran perfectly on the level at any speed, but up hills misfiring would set in, so that sometimes I could hardly get to the top. I was secretly pleased to find a flaw in the Harley's armour of reliability, and proceeded to dismantle the carburetter. It was an interesting task to examine the workings of the Schebler, but all my cleaning made no improvement. Suddenly I remembered an experience on a Calthorpe-Jap before the war. I investigated, and sure enough the porcelain of one of the sparking plugs was cracked. It is curious that this should give rise to misfiring on hills only, which generally makes one think of choked filters and low levels.

My little tour ended dramatically. I had to report at nine o'clock next morning, and for one reason and another did not leave the place where I stayed the night, 12½ miles away, till 8.41. The road is abominable, and there are eleven right-angled corners. But, spurred by thoughts of courts-martial, I blinded wildly all the way, just missing the hedge each time, and arrived triumphantly at 8.58. Average, 44.1 m.p.h.

I am now, alas, at the detestable place I have spoken of, but my Harley is down in the shed waiting for one kick—and then we shall see.

**TAKING A BADLY WOUNDED MAN FOR A SIDECAR RUN.**

Organisers of sidecar outings for wounded soldiers until recently have met with discouragement from medical men of some hospitals, who were not aware of the comfort of a sidecar. However, all this is gradually changing, and at the Dundee Eastern War Hospital the authorities gladly allow a badly wounded man to be taken for a run, as shown in the above illustration. He enjoyed it, too.

## FURTHER TESTS OF CHEAP FUELS.

### A Comparison between Binks Fuel and Petroleum.

HAVING given the results obtained during various tests with the new Binks fuel, we decided to carry out still further trials with a view to procuring some comparisons between this fuel and petroleum. Petroleum—or as it is generally, though incorrectly, called, paraffin—has certain disagreeable and harmful properties as a fuel when used in an ordinary carburetter, but it possesses one great advantage, in that it can be purchased almost anywhere. There are, therefore, many riders who hesitate to adopt the use of a fuel which must be purchased in bulk and sent by rail until thoroughly convinced that it is superior to ordinary paraffin or mixtures of paraffin and petrol, and thus the following tests may be of value.

#### Details of Test.

The trials were carried out over a circular route on good quality moorland roads, though high winds and severe gradients were encountered at intervals. A  $3\frac{1}{2}$  h.p. P. and M. with sidecar, carrying a total load of approximately 20 stone, was used, this machine being fitted with a Binks carburetter specially adjusted for the use of a heavy fuel. Cheap paraffin, having a specific gravity of .800, and containing a small quantity of heavy grade engine oil, was tried, and the results obtained were much in accordance with expectations. The following table gives the results obtained:

FUEL.	PRICE PER GALLON.	M.P.G.	M.P.H.
Binks fuel ... ..	1s. 3d.	83.2	26.4
paraffin $\frac{1}{2}$ Taxibus ... ..	1s. 9d.	78.4	22.6
paraffin $\frac{1}{4}$ Taxibus ... ..	1s. 4d.	76.9	22.1
Paraffin ... ..	1s. 0d.	76.8	22.1

Having completed the route on Binks fuel and carefully noted the running of the machine, we were then in a position to compare the performance of the fuels tried later, and with the half and half mixture of paraffin and Taxibus there was found to be very little difference in the running, except that the engine exhibited a certain sluggishness, and refused to "rev." on the level stretches. The exhaust lacked that sharp crack given with the Binks fuel, but the engine showed no increased tendency to knock, and the climbing was satisfactory.

On the third test, in which three-quarters paraffin and one quarter Taxibus were used, there was a very marked difference. It was necessary to resort to low gear with greater frequency, and those qualities usually described as "elasticity" and "silken running" were entirely lost.

On the final test with pure paraffin the engine became considerably overheated several times during

the circuit, and but for occasional favourable winds it would have been necessary to stop and cool off. Other tests with paraffin produced similar results, the engine beginning to show signs of distress immediately a head wind was encountered.

With the Binks carburetter, I have not as yet discovered that any excess of carbon deposit occurs when paraffin is the fuel used, but from the strong smell of petroleum smoke that issues from the exhaust on sudden load it would seem that liquid fuel gets down to the piston rings. That this causes harsh running and increased wear cannot be doubted, though the precaution of mixing heavy engine oil with the fuel may tend to equalise matters.

#### An Objectionable Feature.

A heavy fuel which will not vaporise at atmospheric temperature is bound to have one great drawback unless it be entirely odourless. If, for instance, any leakage takes place at the filler caps, the fuel percolates over the tank, gets on to one's overalls, and finally into one's clothing. Paraffin is most objectionable in this way, and the Binks fuel, though naturally not so clean as petrol, is certainly less offensive than paraffin.

With a heavy fuel of any kind, however, one must guard against spray from the air intake, as even though slight, this invariably occurs. The sketch shows a simple fitment on the Binks carburetter with which these trials have been carried out. A tin disc is cut to fit loosely over the thread of the plug enclosing the jets, and is held in that position by the thick leather washer. The edges of the disc are turned inward so as to cover the air holes, and this simple device not only protects the rider's legs from spray, but it also improves the consumption by creating an air cushion round the intake.

#### Binks or Paraffin?

The advantages of the Binks fuel would seem that, while presenting a very considerable saving in the fuel bill, it is not harmful to the engine, it produces a clean, sharp explosion, and is far from being so objectionable in use as paraffin, though certain disadvantages are inseparable from the use of a fuel with a high flash point. A 50% mixture of paraffin and petrol can

be made to yield reasonably satisfactory results, but there can be no doubt that a proportion of the paraffin is not used, and that its effect upon the engine is harmful. I cannot ascertain that this occurs with the Binks fuel, and the latter is not nearly so "messy" as paraffin.

H.M.B.

*This article should be read in conjunction with those appearing in "The Motor Cycle" of April 27th, page 399, and May 18th, page 465. The former gave the results of tests with petrol only and Binks fuel only on a Binks three-jet carburetter; the second article dealt with the same fuels, but used in conjunction with a single-jet carburetter.*

Binks horizontal carburetter, showing the tin disc (A) fitted to prevent petrol splashing from the air holes from reaching the legs of the driver. By creating an air cushion this also improves the consumption.

# "THE MOTOR CYCLE" RECRUITING SECTION.

M.M.G.S. and H.S. M.G.C. closed to Recruits until Further Notice.

Central Office for Heavy Section, Machine Gun  
Corps and Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

Central Office for R.E. Despatch Riders:

Mr. T. W. Loughborough,  
A.C.U., 83, Pall Mall, London, S.W.

This section was instituted with the sole object of assisting readers and directing them to the many different branches of the Army and Navy, for which their special knowledge suited them. At the outbreak of war numerous letters reached us (and continue to arrive) from men at home and overseas possessed of motor engineering knowledge, explaining their difficulty in obtaining particulars of Specialised Sections (notably the Motor Sections), recruiting officers being invariably occupied by the demands of the line regiments. The Editor is Inspecting Officer for the M.M.G.S., Heavy Section, Machine Gun Corps, and R.E. Despatch Riders. Throughout, the work has been purely honorary, and Recruiting Commissions have not been accepted. To date 9,745 readers have taken advantage of our proffered assistance.

**T**HIS week Mr. Geoffrey Smith, Editor of *The Motor Cycle*, was to attend at the Recruiting Office, Coventry, on Tuesday, and at Manchester yesterday (Wednesday), to examine applicants for the H.S., M.G.C.

With this week's batch of recruits the Heavy Section Machine Gun Corps, as well as the Motor Machine Gun Service, closes to recruits until further notice, these sections now being up to strength. No doubt many letters of application will be in the post before this announcement appears in print, and instructions are being asked for from the recruiting authorities concerning them. In the meantime car drivers should note that the Army Service Corps (Motor Transport) has again opened for recruits.

Readers in possession of particulars of enlistment giving a date of inspection for next week will understand that the foregoing announcement—based upon a wire received from the Commanding Officer on going to press—cancels the appointment.

A list of recruits accepted in Coventry and London on Tuesday and Saturday last week respectively, is given below.

Allwood, G. H., Peterborough.  
Barber, J., Wandsworth.  
Bennett, W., Glasgow.  
Bentley, C., Sevenoaks.  
Bessant, F., Chesham.  
Bithrey, L. C., Golden's Green.  
Brennand, W., Kendal.  
Brereton, T. A., Liverpool.  
Brown, T. V., Benburo, Co. Tyrone.  
Burden, T. H., Coventry.  
Burhouse, G. E., Leeds.  
Butt, P., Chesham.  
Chesney, E. B., Battersea.  
Cook, J. P., Cannock.  
Cooper, F. P., Ipswich.  
Cooper, T. W., Chorlton-cum-Hardy.  
Coppack, J. C., Chester.  
Cummings, I. V., Romford.  
Dando, A. J., New Southgate.  
Dinwoodie, W. G., Blingie, N.B.  
Dooley, T., Folkestone.  
Dougby, F. W., Grimsby.  
Finch, T., Canterbury.  
Fisher, H. R., Battersea.  
Forrest, A., Planis, N.B.  
Frankland, F., Kendal.  
Fuller, G., Faversham.  
Garbutt, R. J., Coventry.  
Garne, A., Durban.  
Godhold, E. J., Southfields.  
Goodall, W. A. J., Darlington.  
Gosling, S. O., Framlingham.  
Grant, S. D., Durham.  
Green, H., Leicester.  
Green, J. C., South Farnborough.  
Gregg, C., Cleator Moor.  
Greenwood, F. H., Wolverhampton.  
Hazel, A., Waterbeach.  
Henderson, W. R., Stockport.  
Hill, E., St. Albans.  
Hitchings, Glamorgan.  
Holmes, W. G., Blingie.  
Honeysett, B. G., Stockport.  
Hughes, C. E., Finchley.

Hyman, W., Swansea.  
Kent, A., Burslem.  
Kiddell, A. V., Birmingham.  
Lake, K., Eastbourne.  
Langton, L., Morecambe.  
Last, E., Brindon.  
Lee, W. H., Saltley.  
Linsler, A., Leeds.  
Llewellyn, L. C., Brighton.  
Loseby, W. H., Retford.  
London, P., Walthamstow.  
Mackie, C. R., Derby.  
Mansell, F. G., Shrewsbury.  
Marriott, W., Egremon.  
Martin, D., Westcliff-on-Sea.  
McLellan, W., Fraserburgh.  
McLoughlin, J. J., Cahel Co. Tipperary.  
Merriman, C. E., Manor Park.  
Monkman, E. F., York.  
More, U. H.  
Morris, S. J., Salisbury.  
Nicolson, A., London.  
Nowers, R. A., South Croydon.

## CLIMBING BLEA TARN.

ANOTHER EXPEDITION BY MUNITION WORKERS. AN OLD A.C.U. TERROR.

SCENES ON BLEA TARN PASS DURING THE BARROW MUNITION WORKERS' VISIT.

(Above) E. H. P. Scantlebury ( $3\frac{1}{2}$  h.p. Sunbeam sidecar) takes to the grass.

(Right) The best climb was made by R. Boyren, who is seen making his ascent on the  $2\frac{3}{4}$  h.p. Douglas. This picture gives a good idea of the rough surface.

LOOKING DOWN THE LOWER HALF OF BLEA TARN.

I. Wardle ( $2\frac{1}{4}$  h.p. two-stroke Federation) coming to grief.

**F**OLLOWING on the successful munition workers' Lakeland hill-climbing expedition, reported in our last issue, was another the following Saturday, when Blea Tarn Pass was the venue. The proceedings described last week, it will be remembered, dealt with Stoneythwaite Rake and Walna Scar. Nine riders started, the majority coming from Barrow.

Blea Tarn is roughly a mile in length. Commencing at Wall End Farm, the gradient is about 1 in 8. It gradually becomes steeper until, at a bad S bend, it is about 1 in 6. The surface is very loose, and the combination of this and the gradient called for great skill.

Only three men reached the summit—R. Boyren ( $2\frac{3}{4}$  h.p. Douglas), W. Taylor ( $3\frac{1}{2}$  h.p. P. and M.), and G. Dudson ( $3\frac{1}{2}$  h.p. Rudge). The finest climb was made by Boyren, who made two ascents.

Of the others who attempted the climb, J. Wardle ( $2\frac{1}{4}$  h.p. two-stroke Federation) made two excellent tries.

The rider of a  $3\frac{1}{2}$  h.p. twin-cylinder Indian made a plucky attempt, but later on got into difficulties, and was obliged to withdraw. The rider of a  $2\frac{3}{4}$  h.p. A.J.S. distinguished himself by getting into the ditch; he started again, however, on a very bad stretch by the use of his clutch.

There were two sidecar outfits, but neither succeeded in reaching the S bend. E. H. P. Scantlebury, driving a  $3\frac{1}{2}$  h.p. Sunbeam sidecar without passenger, made a good attempt, being able to drive partly on the grass at the side.

# A CENSUS OF PETROL AND A CENSUS OF MOTOR VEHICLES.

## Latest Developments of the Petrol Supply Question.

**D**EFINITE steps have now been taken by the committee appointed by the Board of Trade to enquire into the supply and distribution of petrol. These consist in the decision to take a census of petrol to be followed by one of motor vehicles. With regard to the former, under the Defence of the Realm Act every person who uses or keeps motor spirit, whether for the purpose of supplying motive power for motor cars, or for any other purpose, must supply such information in relation to the motor spirit used or kept by him, and the purposes for which and the manner in which it is used or kept by him, as the Board of Trade may by any general or special order require, giving such particulars in such form and at such times as the Board of Trade may by order direct. If any person fails to comply with this regulation or any order made by the Board of Trade thereunder, or knowingly give, any false information, he shall be guilty of a summary offence against these regulations.

Following the foregoing came the announcement that it is the intention of the Petrol Control Committee shortly to take a census of motor vehicles. In the meantime a sub-committee, consisting of representatives of the chief distributing organisations, has undertaken at the request of the Committee to regulate the supply of petrol according to the classification shown below. The items in each class are arranged in alphabetical order. It is not anticipated that there need be any curtailment at present of reasonable demands in Classes A and B.

### Order of Priority for the Distribution of Motor Spirit.

**CLASS A** includes requirements for or by carriage of munitions of war or materials for munitions of war; fire brigades and ambulances; Lords

Lieutenant, High Sheriffs, and any services certified by a Government Department to be essential; medical practitioners; motor cars used by or under the authority of the Red Cross Society or the St. John Ambulance Association or any other society approved by the Admiralty or Army Council for the conveyance of wounded or sick members of any of His Majesty's forces; police and local government authorities; veterinary surgeons.

**CLASS B** includes requirements for or by agricultural machinery; aircraft; conveyance of goods; industrial processes; motor cabs plying for hire; motor cars used by commercial travellers for business purposes; motor fishing, cargo, and passenger boats other than boats running pleasure services; motor omnibuses, excepting those running pleasure services; railway companies; stationary engines (including lighting sets).

**CLASS C** includes all requirements not covered by Class A or Class B, such as chais-a-bancs and other passenger vehicles running pleasure services; motor boats running pleasure services; motor cars standing for hire in garages, livery stables, hotels, etc.; private motor cars and motor cycles in ordinary use.

Meanwhile the agitation being conducted against "pleasure" motoring by a certain section of the press has somewhat relaxed. There was an excellent letter in *The Times* of last Friday on the petrol supply question, which concluded as follows: "The Government have, I believe, asked the Army Service Corps whether they can suggest any means of economy. This is like asking the wolf if he can account for the disappearance of the sheep."

This is sound commonsense.

Pleasure motoring has been necessarily curtailed to an enormous extent; to forbid it altogether would be a national disaster, and one which the Germans would vociferously acclaim as a victory, while the neutrals would be by no means favourably impressed. The so-called pleasure motoring, which brings health to the town dweller, perhaps once, or at the most twice, a week, is a very necessary asset. To stop its use hinders the development of the motor vehicle, which has so strenuously served the country during the present crisis. We are sure that if it is absolutely necessary no single motorist will object to sacrificing his pleasure for his country's good, but he would like to know first that petrol is not wasted in the Services, and that there is an actual shortage of the precious spirit at the present time.

## AN AMERICAN DUEL IN NATAL.

**T**WO keen Durban motor cyclists, one the possessor of a Harley-Davidson sidecar and the other of an Indian sidecar, decided to put their machines to a thorough test. This took the form of a 214 miles road race, starting and finishing at Durban, touching Maritzburg and Ixopo. We are told that the route included every variety of Natal road, though the worst was in the majority. Many streams had to be crossed, but punts conveyed the two competitors across the larger and deeper rivers.

The Harley-Davidson man started from the Durban Town Hall at 7.45 a.m. on April 30th. A quarter of an hour afterwards his Indian rival started. The latter arrived back at 3.38 p.m., being followed by the Harley-Davidson at 3.42 p.m. Thus the Indian, driven by Jordan, won by 19m.—a very close finish for a 214 miles Colonial road race. The Indian average works out at 28 m.p.h., that of the Harley-Davidson at 26.9 m.p.h.

## PETROL FOR WOUNDED SOLDIERS' OUTINGS.

**A**T a meeting last week of the Leicestershire Automobile Club the committee decided to communicate with the Petrol Supply Committee asking if outings for wounded soldiers would be in conformity with their recommendations in connection with the restriction of petrol supply. Meanwhile it would appear that there should be no difficulty in obtaining petrol for such outings, as the new order of priority for the distribution of motor spirit puts in the first class "motor cars used by or under the authority of the Red Cross Society or the St. John Ambulance Association or any other society approved by the Admiralty or Army Council for the conveyance of wounded or sick members of any of His Majesty's Forces."

Indian and Harley-Davidson riders who raced over 214 miles of Natal roads, the former winning by nineteen minutes at an average speed of twenty-eight miles an hour. Note the sidecar wheel brake on the Harley-Davidson.

## TIME TO LIGHT LAMPS

"SUMMER" TIME.

June 8th	...	...	9.42 p.m.
" 10th	...	...	9.43 "
" 12th	...	...	9.44 "
" 14th	...	...	9.46 "

### American Export Trade.

The American export trade in motor cycles continues to boom. In February last 1,689 machines were exported, as against 724 for February, 1915.

### A Kind Action.

A parcel of eight razors reached us last week by registered post from Mr. C. M. Dewey, Hotel Chelsea, West 23rd Street, New York, in response to the appeal recently published at the request of Mr. Harry Smith, managing director of the Rover Co., who is collecting old razors for the troops.

### A Petrol Tax Only.

Abolish the new taxes and put an additional tax on petrol alone seems to be the most favoured system, according to our post bag. At present, no matter whether a man uses 500 miles of roads in a year or 5,000, the tax is the same. Road damage, too, would be automatically adjusted, as the heavier vehicle naturally consumes a much greater quantity of fuel.

### Importation of Enemy Goods into Australia.

Last December the Commonwealth Government prohibited the importation into Australia of "goods manufactured or produced in, or brought directly or indirectly from, an enemy country," except by special permission. This has now been modified to the extent of permitting the importation of goods which were in the United Kingdom before the outbreak of war with the country in which the goods were produced.

### Grievances of Colonial Buyers.

We were chatting the other day with a motor cyclist who has recently returned home after a five years' stay in one of our Overseas Dominions. The conversation turned to the Overseas trade and the complaints of the Colonial motor cyclists that are so often voiced in the columns of *The Motor Cycle*. Our friend is inclined to take a different view from that usually adopted, his experiences, he told us, leaving him to believe that the Colonial always wanted "something for nothing." He suggested that the average Colonial buyer would be capable of asking the manufacturer what he would allow off the price if he took a coat of enamel off! Needless to say, we do not share the erratic views of our friend.

## SPECIAL FEATURES

A MODERNISED TRICYCLE. MY DEBUT ON A 7.9 h.p. SOLO.  
TWO-STROKE ENGINES.

### Liverpool Motor Cyclist Volunteers.

Mr. S. W. Phillpott tells us that as a result of the paragraph in *The Motor Cycle* last week, mentioning the existence of vacancies in the motor cyclists' section of the Port of Liverpool Heavy Car Battalion of the National Motor Volunteers, he has "been flooded under with applications from all over England." Some people, however, still do not understand that the National Motor Volunteers is a purely volunteer organisation, and that men eligible for the Army cannot be accepted. Only men living in the Liverpool district can join the Liverpool section, but that other sections are being formed in various parts of the country.

### The Ruling Passion.

Dr. Aubrey Harris sends us the following true story, the experience of a lady patient who visits one of the military hospitals. A certain D.R. out in France came into collision with a motor lorry, and came off decidedly second best. He is in a London hospital suffering from a smashed face, a bunged-up eye, a broken arm, and a broken leg. The lady was talking to him, and on saying good-bye asked him if there was anything she could get him which he particularly desired. "Oh, yes," was the immediate response, "if you could get me a copy of *The Motor Cycle*!" His injuries had apparently not damped his keenness.

### The Penalty for Warning Motorists.

A despatch rider has recently been doing good for the cause by warning motorists of police traps. A trap was working on Kingston Hill recently when the despatch rider took up his position in the centre of the control, and waved his arms in warning to drivers of three cars which were being timed. The constable said that as the man was a soldier he did not take proceedings until his conduct in warning motorists became intolerable. The despatch rider was confident that he could not be summoned for warning motorists. He was proved to be wrong, however, and as two speed convictions were proved against him he was fined £7 12s. 6d., including costs. He evidently was unaware that it has been proved to be illegal to give warning of a police trap if the person concerned is apparently exceeding the speed limit while in or when immediately near the control.

The prevention of crime is, in this case, a crime in itself!

FLAGS WERE SOLD IN LONDON YESTERDAY TO PROVIDE SMOKES  
FOR SOLDIERS AND SAILORS.

Miss Lottie Berend, a well-known lady motor cyclist who has ridden in many competitions, is driving the Powerplus Indian. Standing on the pillion seat is the Hon. Judith Denman, daughter of Lord and Lady Denman, Miss Yoskyl Pearson is sitting on the back of the sidecar, and Miss Tyrhitt Drake is in the sidecar.

**Economy and Utility—**

the keynotes of the motor cycle—will be dealt with in all their aspects in a special number of *The Motor Cycle*, to be published on Thursday, June 29th. Convincing evidence of the value of a sidecar to the small tradesman will be included.

**Bristol Wounded Soldiers' Run Abandoned.**

Sec.-Lt. H. Smith informs us that the proposed Whit-Monday picnic for wounded soldiers that had been arranged by the Bristol Motor Cycle Club has been abandoned, owing to the postponement of the Whitsuntide holidays.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund	£5,318,000 distributed		
Fund for the Sick and Wounded	£5,899,309	0	0
Tobacco Fund	3,757,059	0	0
The Queen's Work for Women Fund	107,561	0	0
Fund .. .. .	169,504	8	4

**Motor Cycle Thieves.**

The motor cycle thief continues to put in an appearance at intervals. In the latest instance brought to our notice he has brought off a good haul in the form of a 1915 Matchless sidecar. The engine number is 2/cix. 34,480, under front cylinder; frame No. C2,965, on lug under saddle. The sidecar is a Montgomery. The rightful owner, Charles Symonds, 85a, Haverhill Road, Balham, S.W., is offering a reward for information leading to its recovery.

**Don't Offer Money to a Policeman.**

An officer, attached to the M.M.G.S., who had been riding a motor cycle without a licence, was charged at Woking with attempting to bribe the police. The charge was dismissed.

**Naphtha as a Fuel.**

In answer to a letter published last week on the use of naphtha as a fuel for motor cycles, a correspondent tells us that he has used this fuel with success on a 3½ h.p. Triumph with a B. and B. variable-jet carburetter. He obtains a better mileage per gallon and more power, while starting is quite as easy as with petrol.

**Tests of Petrol Substitutes.**

Following upon our tests of "Spots" on different types of machines, readers of *The Motor Cycle* relate in this issue their experiences.

The cheap fuel problem has received much attention at the hands of this journal, tests having been made of all promising petrol substitutes and energisers, and the results detailed for the benefit of over-taxed readers.

**A Failure of Brakes.**

On Saturday afternoon an accident of a rather serious character occurred on Road Hill, Congleton, Cheshire. It appears that an insurance agent was proceeding down the hill with a sidecar, occupied by a lady, attached to his motor cycle, and another young lady on the carrier. At the top of the hill the driver noticed the danger-post, and shut off his engine and applied his brakes, which, unfortunately, failed to operate. On reaching a bend in the road the machine was going at a furious rate, and was absolutely out of control, with the result that he dashed across the road and collided violently with a stone wall on the other side. The driver sustained a fractured thumb. The lady on the carrier was seriously injured, and conveyed to a local hospital suffering from hemorrhage. The sidecarist luckily escaped with a few scratches and bruises.

**How to Grease a Chain.**

As we were going to press we received a letter from the Coventry Chain Co., Ltd., deprecating the use of boiling grease as a lubricating bath for motor cycle chains. This letter will appear in our next issue.

**Sydney-Melbourne Motor Cycle Record.**

News is expected any moment that J. Booth, the well-known Australian rider of Indians, has put up a record for the Sydney-Melbourne run. The distance between the two State capitals is 570 miles. The present record is, by motor cycle, 23h. 41m.

**Notice to Recruits.**

Recruiting for the Machine Gun Corps, Heavy Section, as well as the Motor Machine Gun Service, has now closed for the time being. The announcement is made on our Recruiting section page this week, the official notice being sudden, as usual.

**Sidecarring in Mexico.**

An American journalist has been following the Mexican campaign by means of a sidecar outfit. One run in particular from El Paso to the U.S.A. Army Base at Casas Grandes was very trying for both rider and passenger. The "roads" were awful, there being a plentiful supply of rough ruts and grass roots.

**The Petrol Question.**

Latest news concerning the petrol supply will be found on page 541. From this it will be seen that the Petrol Control Committee has decided to take a census of petrol, and also one of motor vehicles. In the meanwhile, all types of engines (road, marine, and stationary) using petrol have been divided into three classes for an order of priority for the distribution of petrol.

**Petrol Substitutes.**

A correspondent tells us that he has two ideas for the production of fuels which should, in time, take the place of petrol. One process would necessitate the design of a smaller and stronger engine, but the second would require minor alterations only. The supply of raw material is abundant. Our correspondent is anxious to meet with some firm who would test these ideas, and place the spirit on the market in quantity.

**Newcomers to the Pastime.**

It has on several occasions been stated that the good work of motor cyclists at the Front will be the means of attracting non-motor cyclists who are at present stationed in France to the joys of motor cycling after the war. Our post bag would confirm such a view, as enquiries already reach us from non-motor cyclists at the Front who desire information concerning machines of which they hope to take advantage in happier days. This week we received a letter from a member of a French Artillery Company, enquiring for details of the Phelon and Moore motor cycles, mentioning that he has seen such a machine during the stay of the English troops in his town, and is pleased with its silence, softness, and reliability. "It is almost unknown on the French market," he adds—a fact only too true, but which will no doubt be remedied ere long.

Sergt. W. E. Southcomb May, late hon. secretary of the Motor Cycling Club, who has been in the Motor Machine Gun Section for nearly twelve months.

## RIDING POSITION.

MOTOR BICYCLING HAS OFTEN BEEN LIKENED TO RIDING ON HORSEBACK, AND DRIVING A CAR TO DRIVING A HORSE AND TRAP.

An interesting comparison is afforded by these two pictures—the upper one a remarkable view of a Triumph tester and the lower one that of a rider on a typical hunter.

Which appeals to you?

## THE LATE SIR R. K. ARBUTHNOT.

Our Keenest Amateur Rider gives his Life for his Country.

THE whole British motor cycle community will mourn the loss of one of its most distinguished members, Rear-Admiral Sir Robert Keith Arbuthnot, Bart., C.B., M.V.O., who perished with all his brother officers in the *Defence* in the great naval battle. He was fifty-two years of age, had seen nearly forty years' service in the Navy, and was one of our most able senior officers. By a sad irony of fate his name appeared in the Birthday Honours list as receiving the order of Companion of the Bath simultaneously with the announcement of the loss of his gallant ship during its first encounter with the enemy. No better all-round sportsman ever rode a motor bicycle. He thought cars only fit for women and invalids, and considered that the sidecar spoilt a motor bicycle. Sir Robert's affections were purely for the fast solo mount.

Few people realise what he did for the movement, but that he did it an enormous amount of good is an undoubted fact. He became a devotee just at the time when motor cycling needed all the encouragement it could get. He popularised the sport in the Navy, and what was good enough for the Navy

take the youngsters ashore for a spin, and they had to be good riders and smart on corners to keep up with their admiral.

### As a Trials Competitor.

As a motor cyclist he did great deeds. His finest performance was to come in third in the T.T. race in 1908, no mean feat for an amateur. He never missed an Edinburgh run, and his 1911

Triumph won him a gold medal three years running in this event. He competed in numerous A.C.U. Six Days trials, and in 1912, when he was too late to enter, he acted as an official to that body, of the committee of which he was as active a member as his heavy duties would allow. He was an excellent sportsman, and would never dispute the ruling of the judges in any competition. He was a fearless but careful driver, and a man of

*Wishing Motor Cycle*

*Every success*

*Believe me*

*Yr. faithfully*

*R. Arbuthnot*

was good enough for the Army, and what was good enough for the Services was good enough for the man in the street. It was said at one time that no officer in Sir Robert's ship had a chance of getting on unless he rode a motor bicycle; that was, of course, a libel, as the gallant admiral was keener on their efficiency as officers than anything else. Naturally, however, he collected kindred spirits around him. In peace time he rarely sailed without both his Douglas and Triumph on board, and he would dearly love to

These illustrations show the late Rear-Admiral Sir Robert Arbuthnot in competition on road and track.

### The Late Sir R. K. Arbuthnot.—

few words, but one who was not afraid to speak his mind no matter what the cost. Among those who had the honour of competing with this very gallant gentleman he was extremely popular, but in the Navy, though everyone respected and admired him, few loved him. He was a martinet of the old school, who lived solely for efficiency in his ship, and though severe he was just.

Sir Robert Arbuthnot never sought advertisement. He was proud of his achievements on his motor bicycle, but would have been just as happy if they had never been recorded. Not many months ago a paragraph appeared in *The Motor Cycle* stating that despite the war the admiral found time for a few spins ashore on his favourite Triumph. This resulted in a gentle reprimand in which the sailor pointed out that during war time his exploits ashore were best left unpublished. Many times did he do kind actions to motor cyclists. When the *Lord Nelson* was first commissioned he entertained members of the Newcastle and District M.C.C. aboard her, and when as Rear Admiral he hoisted his flag on the super-Dreadnought *Orion* he invited members of the M.C.C. to view this splendid ship during their Easter tour in 1914, when she lay off Weymouth.

Though since the war Sir Robert has been too much occupied in other directions to devote attention to his motor cycle, he has kept in touch with the movement and its developments through the medium of *The Motor Cycle*, of which he assured us he was a regular and keen reader.

We have lost a dear and valued friend with whom we have spent many joyous days both in England and France, and also one glorious week-end at sea. The nation can ill-afford to lose such men as he, who died as he would have wished with his face to the enemy, his beloved ship his coffin, and the boundless ocean (on whose bosom he had spent his life) his grave. To Lady Arbuthnot and his little daughter we extend our heartfelt sympathy.

### Some Anecdotes.

We were on the bridge of H.M.S. *Orion* when one summer's evening (about six weeks before war broke out) at 5.45 she sailed with three other super-Dreadnoughts from her base. No signals were made, but to the very second the four great ships weighed anchor, and left in line ahead. But not all. One was a long time in going about. We noticed it, and on calling the Admiral's attention he became instantly alert, and said, "Shall I signal 'My guest points out you are not keeping station'?" "Please don't," we replied. But the Admiral would never overlook an incident of this kind, and the signal went through, but, fortunately, our part in the incident was left out.

At eight o'clock the following Sunday morning he was on the bridge having a look round, and the fact that a "snotty" in charge of one of the sailing boats was on the point of making shore with his sail set in a slovenly fashion did not escape the Admiral's eagle eye.

One morning, while we as guests were the only idle persons in the ship and time

hung heavily on our hands for about half an hour, we fitted a valve to the Admiral's Douglas. Towards the end of the procedure the Captain came in the cabin much amused at our method of occupation. "I call that a real 'busman's holiday,'" he said.

Sir Robert Arbuthnot was an all-round sportsman. He was keen on all forms of exercise. Boxing, cricket, football, and golf were all hobbies of his. He recently ran 100 yards against the late Capt. Back, who was some years his junior, and he took to the motor cycle comparatively late in life. His aim was efficiency in all things, and when his midshipmen carried off a cup in the 1914 regatta at Weymouth he was as pleased as if his ship had won a coaling or gunnery record.

### A Secret Unfolded.

There is no doubt that the leaders of the German Navy had a particular grudge against the late Admiral Sir Robert Arbuthnot. It was at the Auto-Cycle Union dinner in 1910 that he made a very eloquent speech, spoken in his usual bluff sailor manner, straight from the bottom of his heart, a talk directly to the motor cyclists present and one which he never intended to be reported in detail. He told how riding a motor bicycle braced the nerves and sharpened the wits, and how it helped him to command a first-class battleship. There was a general election on at the time, and he did not hide his political views. He pointed out that the German Emperor, ever since he came to the Throne, had been plotting against England, and that he meant war, and that the war would be terrible, short, sharp, and decisive, and if we wished to avoid it the best way to do so was to keep out the party with which he had no sympathy and support the other, which would ensure our having a large navy. *The Motor Cycle* did not report that speech in detail, but, unfortunately, sitting next to us was a representative of a daily paper, which printed every word of the speech, with the result that the German Ambassador made a special representation to the King on behalf of the German Empire, so that Sir Robert was dismissed his ship and placed on half-pay. That such a brilliant officer should remain long in such a position was, of course, impossible to conceive, and so he was given a brief holiday, most of which was spent on his faithful Triumph, and then was appointed to a Submarine Committee.

### A NOVEL HEAD PROTECTOR.

The type of head protector illustrated is intended to be worn inside the ordinary cap. The illustration shows the head protector without the cap and also with the cap in place for use in bad weather. It will be noticed that the eyes are to some extent shielded, and that the protector also extends down the back of the neck, performing an extremely useful function.

### THE BIRTHDAY HONOUR LIST.

AMONG the long lists of names figuring in the King's birthday honours we notice those of several well-known people in the motor cycle world:

ORDER OF THE BATH, C.B.—The late Rear Admiral Sir R. K. Arbuthnot, Bart., M.V.O.; some details of his career appear on this and the preceding page.

The Hon. Arthur Stanley, M.V.O., M.P., president of the Auto Cycle Union.

To be a BARONET of the United Kingdom.—Mr. Arthur Philip DuCros, M.P., chairman of the Dunlop Rubber Company.

D.S.O.—Maj. A. E. Holbrook, A.S.C. Before the war he took a prominent part in selecting and purchasing motor cycles for the Army. He was a keen rider of a Zenith.

MILITARY CROSS.—Temp. Capt. S. Bramley-Moore. He and his partner, Mr. F. Hulbert, (now with the Triumph Cycle Co.), manufactured a motor bicycle, known as the Hulbert-Bramley, fitted with a Minerva engine, in 1904. In the early days of the movement he took part in numerous competitions; and did an enormous amount of riding.

The following officers in the M.M.G.S.: Temp. Capt. C. E. Amphlett; Temp. Sec.-Lt. C. O. D. Anderson; Temp. Capt. G. Carr, C. W. Clark, and S. A. Westrop.

### LETTER FROM A MOTOR CYCLIST AIRMAN.

WE have had an interesting letter from Flight-Lt. J. Forgan-Potts, R.N., to whose accident we referred in the issue of June 1st. He writes: "My smash consists of a broken right ankle and sundry wounds, nothing particularly serious, but all very tiresome, since I loathe lying in bed. It came about as the result of landing in the dark after raiding an enemy aerodrome, where I dropped two 65 lb. bombs from 500ft. I have been flying in France and Belgium since last September, and have been very lucky, because, though taking part in every raid since then, I never sustained much damage till this time, when, in addition to the darkness, there was a ground mist.

"The only motor cycling people I have met out the other side that you would know are Spencer Grey, my C.O., and a Belgian called Oleislagers, who is in the Belgian Flying Service—you will remember the latter from the old Canning Town days. Spencer Grey is, of course, a squadron commander in charge of the wing to which I belong. Wilberforce is a flight commander, if I mistake not. Cyril Pullin, who you doubtless remember was in the service, and was at Antwerp and Ostend, was finally invalided out. He is now working in a business at Hammersmith, and in conjunction with him I have just provisionally protected two new inventions." We wish our correspondent a speedy and complete recovery.

# AN AMERICAN MACHINE GUN SIDECAR.

GUN CAN BE HAULED BY HAND ON TWO-WHEELED CARRIER.

THE chief feature of interest about the new Indian sidecar machine gun outfit illustrated on this page is the use of a fourth wheel, carried as a spare when travelling, and used as required for attaching to the bicycle end of the sidecar axle. When the latter is done the gun can be hauled about by hand into any desired position, the two wheels in conjunction with a projecting piece forming a tripod.

In the British M.M.G.S., it will be recalled, machine gun, tripod, and ammunition are quickly detached

from the sidecar and carried by gunner and driver to the desired firing position. Of course, if necessary, the gun can be fired from the outfit. The Indian scheme seems good in that it would enable the gun to be quickly wheeled into position as it is easier to haul this than for two men to shoulder gun, tripod, and its ammunition. On the other hand, in a trench there would be no room for a two-wheeled carrier. When

limbered the gun of the new Hendee outfit can be fired without the gun shield in a wide arc, and with a shield the range extends 180° from front to rear in a clockwise direction.

The new Indian sidecar machine gun outfit. The gun can quickly be wheeled into position.

## THE PHILIPSON PULLEY IN CONJUNCTION WITH A HUB GEAR.

AN Army officer writes to enquire whether the Philipson pulley practically converts a three-speed machine into the equivalent of a Zenith, with the additional merit of reducing the labour of gear changing. It does—but with extra complication. If it is fitted to a machine with a three-speed hub ratioed at, say,  $4\frac{1}{2}$ , 7, and 13, the pulley practically supplies all the ratios intermediate between 4 and 18, and does so more or less automatically, except at the three points indicated in the series. On the other hand, my correspondent is on less sure ground when he hopes that all our gears will shortly be transformed into infinitely variables, by the addition of the pulley, as the trend of design is all against the direct belt drive, and suffrages are at present divided between the all-chain and the chain-

cum-belt. Of course, the ideal gear is a foot-operated infinitely variable adaptable to a non-slipping transmission. The real crux of gear usage, as opposed to gear design, is the difficulty of changing up at high speeds, when it is none too safe to remove a hand from the bar, even momentarily. For this reason one or two designers are trying to fix up a foot change for the higher ratios at any rate. The Philipson, to some extent, meets this point; there is no other gear which does. The two top ratios of my own private road-burner are  $4\frac{1}{2}$  and  $5\frac{1}{2}$  respectively, but it is a good road on which I can make the best use of these ratios; for when I have whacked the machine up to such a pace on the  $5\frac{1}{2}$  that the time is ripe for snicking in the  $4\frac{1}{2}$ , I want both hands to keep it straight and steady on the modern British road. Ixion.

## LETTERS TO

## THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

### Repairing Overalls.

Sir,—I have torn my cycling overalls. Can any of your readers say what will repair them? I have tried solution, but it is a failure.

MAGISTER.

### Copper Cooling Devices.

Sir,—Do you know if Capt. Lindsay would give us further particulars of his copper cooling device? I was most interested in the claims he put forward for it in his article "The First Thousand" in *The Motor Cycle* of May 11th. I recently made some copper wire spiral springs to wedge in between the radiating fins, but I cannot say they were a great success. Obviously, the great drawback to the air-cooled single-cylinder  $3\frac{1}{2}$  h.p. being used for a sidecar is the tendency to overheat, and I think a simple yet efficient cooling device which could be made and fixed with a few tools at home would be a boon to many.

T. E. K. DONALDSON, Midshipman, R.N.

### Paraffin as a Fuel.

Sir,—I have a 1915 two-stroke Calthorpe, which I run quite well on a mixture of paraffin and petrol, in the proportion of two parts paraffin to one of petrol.

I start by inserting a rubber tube from an acetylene generator into the air inlet of the carburetter. It is held in place by shutting the throttle until the slide grips it. The machine invariably starts at once, and after about 200 yards will fire on the paraffin mixture.

I suppose the reason that I have not blown my cylinder head off is that the mixture has been much too rich!

This is a very crude method, but works very well.

LF 2111.

Sir,—I have a 1915 O.K. Junior, and the other day I thought I would try paraffin. I therefore made a mixture of petrol-paraffin of two to one, and found starting just as easy and running no different. The following day I added more paraffin, this making the ratio equal, and then tried it on the road with the engine cold.

I paddled off quite easily, and the engine started in a couple of yards, and there was no difference whatever in the running. The only thing I noticed was a slight dripping from the carburetter.

The other day one of the nipples at the end of the Bowden cable came away, and as I had not another one handy I bound up the end with a little piece of wire and soldered it. This made quite a permanent job.

C. T. DAWSON.

### Carbonisation.

Sir,—The period in which carbon deposit is started in engines, in my opinion, is when starting the engine cold. The great majority of motorists never stop to think to what trouble they are putting themselves by racing an engine at the start. First of all, oil is more readily sucked past the rings when cold. Secondly, the gas is too damp and rich and only partially ignited, with back firing, etc., leaving the soot from those causes to settle on the oil; therefore the first signs of carbon deposit are given.

Moral, never race an engine at the start, let it warm up gradually till the piston has expanded, giving more resistance against oil passing to the top, and the gas is better and drier, leaving no deposit whatever. Fill the engine with oil when it is warm, not when cold and race it. I have had valves bright at 3,500 miles.

B.E.F.

A.M. FRY.

### A Correction.

Sir,—I am constrained to correct an error in your contributor's article "Peace—and War" in the issue of May 25th. Crowborough Beacon is not the highest point in Sussex. Crowborough is 792ft. on the Ordnance map, 804ft. according to Black's "Sussex." Ditchling Beacon is 813ft. on the Ordnance map, 858ft. according to Black's "Sussex."

SON OF SUSSEX.

### Piston Tap or What?

Sir,—I read with interest "Trials Rider's" remarks on piston tap. I am also a rider keen on twins of large proportions, having at present a 7.9 h.p. road racer Indian, single speed and clutch. Now this machine developed no tap till about 1,800 miles had been run, which was about the same mileage as another similar machine had run before tapping. This tap or knock often ceases when the engine warms up, seeming to indicate a loose gudgeon pin. My own case, I consider, points plainly to ignition. It knocks hardly ever on main throttle; but, on the pilot, when picking up especially, if the clutch is not eased, this, or a slight retard, immediately cures the complaint. As for the oil theory, all my oil passes through the front cylinder to the crank case. Undoubtedly the inclined cylinder aggravates the evil. I may say the knock is very slight indeed, and would not be noticed on a noisy engine. I should greatly appreciate experiences of other Indian riders.

SPEED MERCHANT.

### Vaporising Heavy Fuels.

Sir,—In view of the present difficulty in obtaining petrol and the desire to use successfully the heavier fuels, such as Binks XXX, benzolite (which is well known up North), and paraffin-petrol mixtures, I venture to suggest the following

Method of attaching pipe to spraying nozzle

experiment to owners of machines with the Senspray carburetter having a spraying nozzle. Referring to the sketch, a pipe of slightly larger bore than the spraying nozzle is attached to it by brazing or soldering. The pipe is then led close to the cylinder head and six or more turns made around the exhaust pipe, the free end being well belled out and pointing ahead. When the engine is running the temperature of the air passing over the fuel jet should assist in breaking

up the fuel. Of course, it may be argued that the subsequent mixing with colder air passing through the main intake will have an effect opposite to that intended; but I think the device well worth trying, and would be pleased to hear the results obtained. I intended to try it myself, but my time is nearly totally occupied on munitions.

C. MATHER.

**Enclosed or Open Chains.**

Sir,—Respecting the question raised concerning the temperature of the bath for lubricating chains, the temperature we advocate is that of boiling water, viz., 212° F., and we do not recommend that a bath be raised to a higher temperature than, say, 250° F. Above this there is a danger of the material of the chain being affected by the heat, especially the bushes, which have a glass hard surface.

There is no necessity to boil the grease, as it will be sufficiently fluid to get to the wearing parts at the above-mentioned temperatures.

HANS RENOLD, LTD.

E. E. BRADBURY.

**A Plea on Behalf of the War Worker.**

Sir,—The editorial note, under the above heading, in your issue of May 25th, must have been appreciated by all those war workers who are affected by the proposed new taxation and the continued increase in the price of petrol.

Having been in close contact with hundreds of munition workers, who are putting forth every ounce of energy in order that material may be forthcoming with which to defeat the enemy, it does appear to me a scandal that, in addition to being called upon to pay extra taxation for owning a motor cycle, they should have to pay an increased price practically every week for petrol. I know of no finer tonic for the man who has, say, been working for twelve to fourteen hours a day, possibly more, at the bench, and for six days a week, than a run into the country on the seventh. We are continually asked to economise. What cheaper form of sport is there, I would ask? And what will happen if our friend the war worker cannot use his machine owing to the excessive price of petrol and possibly a limitation to its use by Government enactment? Will he spend less during the time the machine is laid up? Of course not.

If the war worker could be satisfied that the extra amount he is called upon to pay for petrol was finding its way into Government coffers I do not believe many would complain, but pay cheerfully; but when it is an undoubted fact that advantage is being ruthlessly taken by a clique to enrich themselves during the greatest trial this nation has ever undergone, it is time the Government adopted a drastic line and placed a maximum upon the price of petrol. E.P.

**"Spots."**

Sir,—I read with interest the article on "Spots" in your issue of May 25th, particularly as I have been seeking economy in the same direction. The only remarks I have to make on the article are that "one swallow doesn't constitute a summer," and that, having conducted many machinery trials, I have found that very little reliance can be placed on results obtained from short tests.

My mount consists of a tandem tricycle with Auto-wheel attached. Prior to the use of "Spots," the wife and I had run it about 4,000 miles, and the conclusion came to, as to its economy, was that it was good for 90 m.p.g. With a view to checking this for comparison, I ran the tank—which holds half a gallon—out to a finish on a run through Ripley, Guildford, Cranleigh, Ewhurst, and back by the Dorking Road. Careful plotting gave the distance covered as forty-seven and a half miles. A second trial was made on a run to East Clandon and back. The distance run was fifty miles, and there was still a little petrol remaining in the tank.

Using "Spots" according to the instructions given, I made a trial run to Bramber Castle and back, carrying an extra half gallon of petrol for the return journey, going by the Brighton Road out of Horsham, and picking up the Worthing Road after passing West Grinstead on the way back. I ran out of petrol two miles from home, having then covered ninety-three miles.

A second trial on a run to Bagshot Heath and back gave forty-nine miles to the half gallon. Judging from these trials, I fail to see where the 25% economy in using "Spots" comes in. I have a considerable number of them left, which, if they do not prove injurious in other respects, I shall continue to use, and should I ever obtain any appreciable measure of economy, in justice to the producers, I will let you know.

HOMOCEA.

Sir,—I have read with interest the article on "Spots" in *The Motor Cycle* of May 25th, in which your corre-

spondent gives his experiences with a quart of the prepared spirit.

I have tried this preparation for several months, using eighteen to twenty gallons of the prepared spirit; my next door neighbour has also been trying it, and we have compared notes, and find we agree. Mine is a special  $3\frac{1}{2}$  h.p. engine, tuned up for very fast work, and used with a featherweight sidecar; his is a slower tourist machine with a heavy sidecar, also  $3\frac{1}{2}$  h.p. I have been a motor cyclist since 1905, and usually drive with loaded sidecar as fast as the roads permit; my neighbour drives slower, but is a glutton for hill work.

Our experience is this, apologising for being at variance with your contributor, we can and do give more air, considerably more, than without "Spots." We find considerably more power on hills, and it is faster everywhere, a little better consumption, and a great difference in the action of the engine, which is difficult to explain, but which is very noticeable. The drive feels much smoother, instead of the feeling of being carried along by a series of jerks. Before I tried "Spots" I never noticed the feeling of jerkiness alluded to, but after driving with "Spots" for 1,000 miles and coming back to pure spirit after filling up at a garage on a long ride, this feeling was most pronounced, and the engine vibration seemed most excessive. On the grounds of comfort alone I should never drive without "Spots" again, except under circumstances over which I had no control.

Another peculiarity I have noticed is that the carbon has been very soft, and has come off much more easily since using "Spots" than before.

Re the paraffin controversy, I have for some time been in the habit of doing a considerable distance with 25% paraffin, and then returning to petrol for comparison. I find little difference between the two, but if the paraffin is increased power is lost and the engine heats.

CHIEF CONSUL, C.T.C.

**Another Family Sidecar.**

Sir,—Being a constant reader of your delightful and intelligent paper for over three years, I have often been interested in the illustrations and accounts of readers' machines. Having had some postcards taken before joining up at the end of April, I thought you would be interested in one accompanying this letter.

My machine is a 1915 New Hudson. You will notice that it has a good load to take about, and Bristol is rather hilly. I have been several hundreds of miles, and have only had one stop, caused by a broken fastener, on Black Horse Hill, on the way to New Passage. I can go up the hill, also Park Street, on second gear. I average about 65 to 70 m.p.g. I have fitted an electric S.C. light and rear light in series, with a light inside the car to show if the rear light is working.

E. CLEMENTS.

A family sidecar outfit that has given its owner satisfaction. It is a New Hudson, and the rider, E. Clements, gives his experiences in a letter on this page.

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Fitting a Cut-out Switch.

**?** I am thinking of having a cut-out fitted on to the handlebar of my Lincoln-Elk motor cycle (Bosch magneto). Please let me know if by doing this I shall be running any risk of damaging the magneto in any way.—R.B.

No, you will not run any risk of damaging the magneto by fitting a magneto switch. There is no reason why there should be more risk of damaging a motor cycle magneto than a car magneto, which is always fitted with a magneto cut-out.

## Heating the Air Intake.

**?** A friend of mine told me that he had seen a couple of motor cycles fitted with a hot air intake, and the owners had told him they had improved their consumption by 20 m.p.g. and also the running, and he advised me to try the idea on my machine. As it was only an inexpensive job, and I had seen similar ideas in your paper from time to time, I took it to a mechanic, as I have not the time, and explained what I wanted, viz., a copper or iron pipe from the carburetter (Amac) to the cylinder. The mechanic rather tried to put me off the idea, as he said that cold air is required to keep the cylinder cool, and that the hot air would cause overheating, set the carburetter on fire, etc. If you will kindly say if it will be satisfactory I should be greatly obliged. The makers fitted a 55 jet, and I have altered it to a 51, and it seems to give just as much power. Should I chance a still smaller jet, or would it be inclined to cause overheating owing to too weak a mixture? I believe some weeks back I saw an answer to a question on coasting down hill, and you advised him not to put the lever into neutral, but to keep in high gear and lift the exhaust lever, with clutch out. I always get into free engine with air wide open, thus cooling the engine. When I slow down to about 8 or 10 m.p.h. I start the engine and slip into middle, and then high, and have always found this satisfactory. Is not this correct?—W.P.

The mechanic was in error. You want to keep the air coming into the carburetter as hot as possible, and hot air will in no way cause the machine to overheat, but will assist the vaporisation of the petrol. As to the suggestion that it will set the carburetter on fire, this is abso-

lutely absurd. Have the alteration carried out in the manner suggested, and we are sure you will get considerable improvement in running and economy, though a saving of 20 m.p.g. is a little too much to expect. Having fitted the warming pipe you may be able to use an even smaller jet. It is a most extraordinary fact that motor cycle makers have entirely failed to realise that the warming of the air before entering the carburetter is most beneficial. How beneficial can be told by driving a car which is fitted with a controllable hot water jacket to the vaporising chamber of the carburetter. We once carried out the experiment by cutting off the hot water on one of the hottest days in the summer. After running about two miles like this we were very glad to turn the hot water on again. Your method of descending a hill is quite all right.

JUNE 29th, 1916,

THE DATE OF

THE  
MOTOR CYCLE

Economy and Utility  
NUMBER.

## Clutch Slip.

**?** I have purchased a second-hand N.S.U. gear. I find it works well in low gear and free engine, but when the control lever is in the high gear position the engine is tearing away at a great speed and the machine is scarcely moving. The gear seems very tight and gets very hot, almost too hot to put my hand on. I have well oiled it. It seems very hard to start, being in gear, I believe. I possess another machine with an N.S.U. gear, which works very well, and everything is slack and has plenty of play. Does it harm the N.S.U. gear to coast down hills in free engine position?—W.M.

We should say that the trouble is probably due to too weak a clutch spring, or to the top gear cone clutch, which is worn and consequently slips. You should make quite certain that the operating fork is quite clear of the pin which moves the clutches when the lever is in the top gear position; if it fouls this pin it will prevent the top gear clutch going right home. The operating mechanism

should be slack when top gear is in engagement. When you have made quite certain this point is in order the gear should be taken down and examined by an expert, and new parts fitted if necessary. There is no harm in coasting down hills with the clutch out with this gear.

## Sidcar Alignment.

**?** I have read with interest the article "The Risks of Imperfect Alignment," by "H.M.B.," in your last issue, and would appreciate information respecting any published matter on how to obtain correct alignment, or a further article on how to secure this.—W.J.R.  
The information for which you ask is contained in *The Motor Cycle* of March 2nd, page 198.

## Running on Paraffin.

**?** Since the Government seems to be about to limit the sale of petrol, I should be much obliged if you would inform me on the following points. My machine is a 1915 two-speed countershaft four-stroke, fitted with an Amac carburetter. (1.) Provided I fit up a small tank for petrol for starting, will paraffin do any harm to the engine? I do not see how I can fit up a hot air intake to my carburetter. (2.) Is it true that paraffin dilutes the engine oil? Shall I have to lubricate more freely? (3.) If the sale of petrol is prohibited, will it be permissible to run a motor bicycle on paraffin? (4.) My machine has a top gear of 6½ to 1, and I live at Sheerness. Is not this excessively low for a fairly flat country? Could I remedy this by fitting a larger engine sprocket?—L.B.W.

(1.) Paraffin will not do much harm to the engine if you can get the combustion reasonably good. Fit a pipe from the fixed air intake of the carburetter with a funnel end attached close up against the cylinder. (2.) If there is much unburnt paraffin about, it will dilute the engine oil, but we do not think there is much risk. (3.) We have received no information on this subject at the present time, but we do not imagine there will be any objection to running on paraffin. (4.) It depends upon the horse-power. If the machine is of small horse-power, the gear would be about right for general use in most districts, but you could certainly do with a higher gear, which you could fit by having a larger engine sprocket, for the flat country in which you reside.

**Weak Mixture.**

?

Would you please tell me how I can remedy the following trouble? I have a 2½ h.p. two-stroke engine which will take practically no air without blowing back through the carburetter (Amac), and the same trouble occurs if I open the throttle more than half way. Of course, under these conditions the engine labours up hills and gets hot. It is lubricated by the petrol system, and has done about 150 miles. —A.G.P.

The symptoms of your trouble indicate a weak mixture, which may be caused by too small a jet, jet partly choked, petrol feed or carburetter passages partially choked. You should clean out the petrol supply pipes and carburetter, and if the trouble continues then try fitting a larger jet. Make sure there are no air leaks either between the carburetter and engine, or through the crank case joints. Bind any doubtful joints with adhesive tape.

**Falling off in Power.**

?

I have a 6 h.p. twin with a two-speed gear, box and 1912 B. and B. carburetter, which, after previously having been a good climber, has suddenly refused to climb ordinary hills on low gear which it used to take on top gear. The first time the machine failed me I found that the carburetter was starved. When it stopped I shut off the petrol, took off the float chamber lid, and found the chamber only had about lin. of petrol in it. I could find no obstruction in the pipe or the carburetter, but the float was punctured. I have since fitted a new needle valve, float, and jet, and the machine certainly runs better. The engine itself is in good condition, and the valve and the magneto timing are correct. I have no misfiring. I have thoroughly cleaned out the silencer. Since fitting new needle valves, etc., I have tried the machine on low gear with the throttle wide open on a short, fairly stiff hill, and it takes me a good part of the way up, and then gradually stops without any knocking, but on this occasion I found plenty of petrol in the chamber. On the level or gradual slopes the machine runs splendidly. The jet is a No. 32. The carburetter will not take the air lever beyond the throttle even at 20 m.p.h. After a run of about ten miles the engine gets very hot, although being well lubricated with the oil recommended for this engine. My petrol consumption is very heavy. I am only able to get about 30 m.p.g. with side-car and 12 st. passenger. When the machine is standing the petrol drips slightly at the bottom of the jet. —HILL-CLIMB.

Your trouble may be due to air lock in the petrol pipe or tank, caused perhaps through having no air vent in the tank stopper. The heavy consumption is probably caused through the petrol level

being too high, which is indicated by the petrol dripping from the carburetter when standing. Incorrect carburetter adjustment is also probably the cause of the overheating. Make sure your valves are seating properly, and the clearance between the valve stems and tappets is not too great.

**Fitting an Extra Belt Fastener.**

?

(1.) Will you kindly tell me if any harm is done by using an extra pair of links on a belt? The wear is on the ends, necessitating continual shortening. The other part of the belt being quite sound, would be good for many miles, if no harm will be done by using it in this way. (2.) I have a bottle of sperm oil, which I keep in my cycle shed. In cold weather it goes cloudy, and when it resumes its usual clearness, about half an inch of sediment appears at the bottom. In using the oil, should only the clear part be employed, or are there any qualities in the sediment necessary in the lubrication? I use this oil for my hub gear. (3.) Should there be any side play in the exhaust tappet and guide? The inlet gets plenty of oil, and throws it up through the guide, but not from the exhaust, and there seems to be a fair amount of side play. —E.W.S.

(1.) The only harm you do by fitting two links on a belt is that you slightly reduce the driving qualities of the belt, but really it is hardly appreciable. (2.) All oils tend to thicken in cold weather. Perhaps before using it, it would be as well to warm the bottle and shake it up, when all the contents will then be of the same consistency. (3.) There should be no appreciable side play in the exhaust tappet and guide.

**Knock in Hub.**

?

As a constant reader of your paper, I should be much obliged if you could help in the following matter. My machine, a 1914 3½ h.p. single with Armstrong three-speed gear, Mark III., has a nasty knock in the hub. On dismantling the gear I found there was a decided looseness between the inner and outer portion of the clutch, due to the keyed phosphor-bronze plates which engage with the slots in the hub shell being worn at the keys. These keys are exactly .34 in. smaller than the slots in the hub shell. I could get hold of the belt rim and the back wheel and oscillate one against the other. Would this cause the knock? The hub only knocks while travelling on too high a gear in relation to engine speed to road speed, but as soon as the machine picks up road speed the knock disappears. —J.R.G.

The knock which you hear is undoubtedly due to wear of the clutch plates. This knocking is frequently noticeable in an almost new hub if driven slowly on top, owing to the back lash in the gears, which it is practically impossible entirely to do away with. If this lash is accentuated

by wear the knock is, of course, even more noticeable. We would recommend you to have new clutch plates fitted.

**RECOMMENDED ROUTES.****EXETER TO PLYMOUTH.—C.E.W.**

Exeter Chudleigh, Ashburton, Ivy-bridge, Plymouth. Approximately 43 miles.

**MANCHESTER TO CRICCIETH.—H.H.S.**

Manchester, Altrincham, Northwich, Crabtree Green, Chester, Mold, Ruthin, Bala, Festiniog, Portmadoc, Criccieth. Approximately 110 miles.

**PLYMOUTH TO NEWQUAY.—H.P.**

Plymouth, ferry to Torpoint, Polbathick, Liskeard, down Glyn Valley, Bodmin, Lanivet, Indian Queens, Newquay.

**LOUGHBOROUGH TO BRISTOL.—C.E.W.**

Loughborough, Leicester, Sharnford, Coventry, Kenilworth, Warwick, Stratford-on-Avon, Broadway, Winchcomb, Cheltenham, Gloucester, Stone, Bristol. Approximately 133 miles.

**HUNGERFORD TO WEYMOUTH.—W.N.C.**

Hungerford, Newbury, Whitechurch, Winchester, Romsey, Cadnam, Ringwood, Wimborne Minster, Bere Regis, Dorchester, Weymouth. 105 miles approximately.

**LIVERPOOL TO TORQUAY.—J.G.**

Liverpool, ferry to Birkenhead, Sutton, Chester, Broxton, Whitechurch, Hodnet, Cradgington, Wellington, Bridgnorth, Kidderminster, Hartlebury, Worcester, Tewkesbury, Gloucester, Standish, Stonehouse, Nailsworth, Swainswick, Bath, Chewton Mendip, Wells, Glastonbury, Othery, Durston, Taunton, Wellington, Cullompton, Exeter, Chudleigh, Newton Abbot, Torquay. 275 miles approximately.

**BLACKBURN TO WOOLWICH.—D.P.**

Blackburn, Chorley, Wigan, Warrington, Knutsford, Holmes Chapel, Newcastle-under-Lyme, Stone, Rugeley, Lichfield, Tamworth, Atherstone, Three Pots, Kilsby, Daventry, Towcester, Dunstable, St. Albans, Barnet, New Barnet, Enfield, Ponders End, Chingford Green, Woodford Wells, Woodford Green, Barking-side, Ilford, Wallend, North Woolwich, ferry across Thames, Woolwich.

**GILLINGHAM TO BRISTOL.—A.D.C.**

Gillingham, Wrotham Heath, Ightham, Westerham, Oxted, Godstone, Redhill, Reigate, Dorking, Shere, Guildford, Farnham, Odiham, Basingstoke, Kingsclere, Newbury, Hungerford, Marlborough, Calne, Chippenham, Marshfield, Bristol. Return through Bath, Melksham, Devizes, Rushall, Ludgershall, Andover, Whitechurch, Odiham, and then by the route we have previously given.

**PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.**

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the import of paper material by always having their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

### A Lubrication Improvement.

The ideal lubrication system should supply oil to the engine in proportion to the work being done, and this is attained, in the case of two-stroke engines, by this invention, which is shown applied to a carburetter of the Triumph type. The gas passage to the engine is shown at A, and the ordinary throttle barrel at B. The movement of the throttle barrel regulates the flow of oil, so that as the throttle is opened the oil supply is increased, and *vice versa*. This is effected by conducting the oil to a chamber C, the upper end of which communi-

cates with the gas passage A. Passing through this outlet is a taper needle D, attached to the throttle barrel. Thus, as the barrel B is raised, the oil outlet is increased in area, and more oil passes to the engine. Various alternative methods may be adopted, and the incorporation of the device with the carburetter forms a very neat and ingenious construction.—G. E. Stanley, (No. 11,470, 1915.

### A Simple Side-carrier.

The main tube A is provided with sockets B C in which are secured the members D E, which are adjustable in the sockets to permit of application to cycles with wheels of different diameters. The carrier frame F has a pivotal connection at G with the tube A, so that the cycle and the carrier can assume varying angles, compensating for rough roads and allowing the cycle to incline when turning corners. At H is a locking device whereby the carrier frame can be locked to the tube A, rendering the parts rigid and allowing the carrier to act as a stand and maintain the cycle upright.—A. W. Wall, Ltd., and J. A. Richardson, No. 320, 1915.

### Two-stroke Ignition Improvement.

In order to avoid misfiring at low speeds in two-stroke engines, it is here proposed that the ignition spark be located in a passage A in the cylinder wall, which is filled with pure gas. When the plug is located in the cylinder proper

the points are surrounded by a mixture which is more or less polluted by retained exhaust gases. The passage A is always open at the top, as shown at B, whilst its lower end is closed by the piston wall, except for a brief period when the piston is approaching the lower end of its stroke. Immediately after the exhaust port C is opened, and before the transfer passage is opened, an orifice D in the piston wall comes into register with the passage A, with the result that a portion of the charge under pressure in the crank

case passes into the passage, forcing out the exhaust gas therein. Next the ordinary transfer passage is opened, and the remainder of the gas in the crank case passes into the combustion chamber in the ordinary way. The fresh gas is retained in the passage A until the spark

takes place, when it is ignited, and in turn ignites the main charge.—W. R. F. Patchett, No. 14,303, 1915.

### The Douglas Soldiers' Fund.

Since the institution of the above fund, which is supported by employees of Douglas Bros., 734 parcels have been despatched to 104 former comrades now on active service. The employees, both staff and workmen, are doing excellent work in looking after those who have gone, and also in assisting dependants.

### A London Magneto Hospital.

We understand that Imperial Motor Industries, Ltd., are enlarging their premises at 11, Denmark Street, Charing Cross Road, W.C., in order to cope with the demand for the quick repair of damaged magnetos and the supply of spare parts thereof.

### Rotax Accessories.

Motor cyclists living in the Willesden district will be interested to hear that Rotax accessories may now be purchased at the Rotax Willesden works. The latter are ten minutes walk from Willesden Junction, just off the main road between Willesden and Acton.

### An Attractive Sidecar.

The sidecar used by E. Kickham in the Birmingham M.C.C. Easter trial, and illustrated on page 403 of our issue of April 27th, has evoked much interest. It may be as well to mention, therefore, that the sidecar in question is being marketed by Mr. Kickham himself. His address is 43, Stokes Croft, Bristol.

### Bradburys in the Southern Counties.

A. F. Godwin, the Bradbury representative for London and the South of England, has joined the Royal Flying Corps as a car driver. Any correspondence with customers in this district will be dealt with direct by the head offices of Bradbury and Co., Wellington Works, Oldham, or may be sent to Mrs. Godwin, 8, Aycliffe Rd., Shepherd's Bush, London, W.

### Catalogues Received.

Ariel Motor Cycles, 1916. Ariel Works, Ltd., Bournbrook, Birmingham. The Ariel catalogue makes its appearance somewhat later than usual this year owing to printing difficulties, but it has been worth waiting for, as it is a really good production.

E.I.C. Magnetos: Booklet No. 1. The Electric Ignition Co., Ltd., Sampson Road North, Birmingham. An excellent handbook dealing with the E.I.C. magneto, of which, we are told, 15,000 have been manufactured since the outbreak of war. It is well illustrated, and deals with the magneto in a thoroughly practical way. Those motor cyclists who are joining a technical corps in which a knowledge of the working of a magneto is desirable would benefit by a study of the E.I.C. booklet.

Montgomery Sidecars. W. Montgomery and Co., Coventry. We are in receipt of the Montgomery Book, the fourteenth annual brochure issued describing the excellent products of this firm. In this publication numerous models of sidecars produced by this company, who were one of the pioneers firms in sidecar construction, are illustrated and described. One of the most interesting, of which we shortly hope to have some personal experience, is the type with spring axle, intended for spring frame machines.

## MOTOR CYCLES FOR SALE.

## Auto-Wheels.

- 14 h.p. Auto-Wheel and Cycle, 1914, good condition: £11.-10/-, Mnsgrave St., W. Hartlepool. [X1290]
- AUTO-WHEEL, late 1914, in excellent condition; £8/15.—Eagles and Co., High St., Acton, W. [X1394]
- AUTO-WHEEL, excellent order, just overhauled, nearly new tyre; £8/10.—Glazebrook, Castle Rd., Kenilworth. [X1407]
- WALL Auto-Wheel, 1914, latest, single lever control, little used; bargain, £8/10.—Murray, 37a, Charles St., Hatton Garden, Holborn. [X1354]

**BEST Offer** over £50 secures Scott and fine coachbuilt sidecar, not used for one year till 3 weeks ago, overhauled, 1915 spring forks, new tyres, 1915 piston; trial by appointment.—8, Old Rd. West, Gravesend. [6604]

**SCOTT**, 1914, just re-bushed, Binks carburettor, Lucas accessories, Jones speedometer, also special aluminium sidecar, hood, screen, exceptional condition, absolutely reliable.—213, Rake Lane, Wallasey. [X1366]

**1913 Scott and Gloria Sidecar**, speedometer, full equipment, fine condition; any reasonable trial given; £33/10.—Tuke and Bell, Ltd., Motor Dept., Carlton Engineering Works, High Rd., Tottenham. [5894]

## Singer.

**SINGER** 1914 Lightweight, speedy, good order; bargain, 20 gns.—Ward, 7, Victoria Parade, Muswell Hill, N. [6485]

**SINGER**, 1913, 3½ h.p., 3 speeds, clutch; bargain, £19/10, offers nearest; property of officer once abroad.—Hinds, Brightingsea, Essex. [6521]

## Sun.

**SUN-VILLIERS**, with lamp, tools, and horn; £20.—Reed, 41, Berners St., Ipswich. [X1216]

**SUN-VILLIERS**, 2½ h.p., new but shop-soiled; £27 to clear.—Walsh Motor Co., Ely, Cambs. [X1470]

**SUN**, 2-strokes; all models from stock from £29/10.—Colmore Depot, 261, Deansgate, Manchester. [6025]

**COLMORE Depots**, Birmingham and Manchester, for delivery from stock of all models of Sun motor cycles. [0807]

## MOTOR CYCLES FOR SALE.

## Sun.

1915 2½ h.p. Sun-V.T.S. used twice only, equal to new; cheap. £24.—Walbro Motor Co., Saffron Walden, Essex. Phone: 45. [X1435]

SUN-PRECISION. 1913, 3½ h.p., 3 speeds, clutch, new speedometer, all accessories, very little used, powerful sidecar machine; £35.—Platford Mill, Leigh, Lancs. [X1289]

SUN-VILLIERS. 1916, 2½ h.p., 2-stroke, 2 lamps, horn, speedometer, tools, accessories, perfect, done 600 miles, unpunctured; £28, cost £36; owner enlisted; seen any time.—91, Lennard Rd., Penge. [6535]

SUN-VILLIERS.—All 1916 2-stroke single and 2 speeds ex-actual stock, also Sun V.T.S. Call or write for list. Exchanges arranged.—Maudes' Motor Mart, 100 and 136, Gt. Portland St., London, W. Tel.: 552 Mayfair. [6571]

## Sunbeam.

SUNBEAM, new 1916 3½ h.p. standard model actually in stock.—Moss, Wem. [X1329]

1916 3½ h.p. Sunbeam, with Skiff Mills-Fulford sidecar, usual black-gold finish, with 2 lamps, horn, etc., latest improvements; instant delivery; £87.—Robinson's Garage, Green St., Cambridge. [6495]

SUNBEAM, late 1915, 6 h.p., 3-speed, with Sunbeam sidecar, all complete, done no work owing to owner being on active service; trial and inspection by appointment with The Chauffeur, Rolleston Hall, Burton-on-Trent. [6203]

1915 6 h.p. Sunbeam and Gloria cane body sidecar, with luggage grid, etc., fitted with Lucas lamp, speedometer, and wind screen, tyres good, turnout in first-class condition; £80, or close offer.—Capt. Saxty, Holly Lodge, Bloomfield, Bath. [X1446]

6 h.p. Twin-cyl. Sunbeam, with No. 2 sidecar, spare wheel and tyres, Lucas dynamo lighting set, and all accessories, late 1915 model, only run 600 miles; cost £140; can be seen at Westminster by appointment.—No. 1, 531, c/o The Motor Cycle. [6391]

SUNBEAM, 1914½, 6 h.p., 3-speed countershaft, Gloria coachbuilt sidecar, speedometer, Lucas 3 gn. lamps, 2 nearly new heavy Clincher, spare tube, excellent condition, splendid engine, kick start; 70 gns.—Rev. Nixon, 7, St. Loo Mansions, Chelsea, London. [6427]

1915 Sunbeam, 3½ h.p., low built, specially constructed for the Isle of Man race, about 1,000 miles only, picked engine, 3-speed kick-start, very fast, semi-T.T. bars, 2 Lucas lamp sets, Cowey £4/4 speedometer, horn, 3 toolbags.—Robinson's Garage, Green St., Cambridge. [6494]

## T.D.C.

3½ h.p. T.D.C., cane sidecar, 4-point, chain-cum-belt, 32 S.A. countershaft, clutch, Bosch, Druids, Best, Lloyd, 650×65, new Sunstone, lamps; £36; exchange higher power, adjustment; separate.—23, Westland Rd., Wolverhampton. [X1404]

## Triumph.

TRIUMPH, 1908, good order; £13.—Grover, Bletchley. [X1255]

TRIUMPH, 1913, clutch model, in beautiful condition; £30.—Grover, Bletchley. [X1254]

1916 Triumph Junior, run 30 miles; 10% discount.—Lamb, Murray Place, Stirling. [X1297]

TRIUMPH 1912, 2-speed, free engine; £23, bargain.—29, St. Leonard's St., Bow. [6453]

TRIUMPH, 3½ h.p., £25; not rubbish; owner enlisting.—1, Rectory Lane, Tooting, S.W. [X1443]

1916 4½. Countershaft Triumph, new; immediate delivery.—M. Trethewey, Roche, Cornwall. [6370]

TRIUMPH, 1912, sidecar, 3-speed, splendid condition; £26.—Plough Garage, Clapham Common, London. [6273]

TRIUMPH, 1907, good running order, accessories; £11, offers.—68, Evelyn Av., Newhaven, Sussex. [6351]

1910 T.T. Triumph, in good condition; a bargain, £20.—Jones, Garage, Broadway, Muswell Hill. [6244]

TRIUMPH, 1910, handle-bar and foot controlled clutch; £21, best offer.—Black, Crown Hotel, Alloa. [X1222]

1912 3½ h.p. Triumph, clutch model, in perfect order, accessories; £27/10.—Railway Garage, Staines. [6553]

JUNIOR Triumph, 2½ h.p., 2-stroke, with accessories, perfect; £32, no offers.—Stephenson, 7, Orchard St., Tamworth. [X1479]

TRIUMPH, 1913, 3½ h.p., 3-speed, free engine, just overhauled; £37.—Ellston, Rye Hill, Haslingden, Lancashire. [X1306]

TRIUMPH, 1909, clutch, sidecar, new tyres, re-bushed, good order; bargain, £25.—20, Bowen Rd., West, Harrow. [6533]

3½ h.p. Triumph Motor Cycle, overhauled by makers, 32 new tyres; £21, or best offer.—C/o Withnall's Garage, Reading. [6271]

TRIUMPH, 1910, T.T., good condition, new tyres; exchange good push bike, cash.—Lamb, Aerodrome, Milton, Pembroke. [6294]

TRIUMPH, 1910, with Brampton variable gear, and torpedo wicker sidecar; cheap, £21.—Toms, Catherine St., Leicester. [X1064]

TRIUMPH, 1910 and 1909, both good condition, re-bushed; £17 and £15; ride 30 miles.—Stuart, Hatfield Heath, Essex. [6526]

## Where the Petrol goes!

**W**E are pleased to note that the leading daily papers are beginning to realise a fact which we have been pointing out, almost *ad nauseam*, for many weeks, namely, that the motor cyclist who uses his machine for necessary journeys is not the unpatriotic sinner which he has been represented to be, nor is he responsible for the shortage of petrol, if this exists. There may be some difference of opinion as to what constitutes a *necessary* journey. Naturally all professional trips must come under this heading, so also must a man's daily journey from his home to his place of business. In some cases, of course, this last may be made by train, but often the trains are very inconvenient as well as crowded, and it seems to us that a man who helps to relieve the morning and evening congestion on the railways is a benefactor rather than otherwise.

It may be urged that pedal cycles should replace motor cycles as the vehicles on which those who live in the country should reach their places of business, and it must be granted that in the matter of economy they excel where their use is practicable. It is, however, not every middle-aged man who can add the necessary effort to the toils of the day; moreover, in bad weather the pedal bicycle is the worst vehicle in existence, for it is impossible to wrap up adequately against the elements, and, at the same time, not suffer from excessive perspiration, and a wet arrival at the office is bound to have undesirable results.

Apparently the Petrol Committee has not recognised the economy of the motor cycle for the work we have just mentioned, for while taxicabs are placed in Class II., motor cycles are in Class III. in the matter of petrol supplies. Now a man who rides to business on his motor cycle and spends 6d. in fuel would, if he hired a taxicab for the purpose, use about 4s. worth of petrol, for the cab would have the double journey morning and evening; he would also be

employing a man who might be much more usefully employed on some productive work, and the cost would be from 15s. to 20s. per day.

There has recently been some sort of an enquiry made with reference to the charrs-à-bancs which run on purely pleasure trips at many of our health resorts, both by the sea and inland, and it has been found that thousands of gallons of petrol are being used in this way, for the consumption of these road destroying vehicles is something like five to eight miles per gallon, whereas many a motor cycle can do upwards of 100 miles on the same quantity, which means, even at the present exorbitant price, three miles and upwards for one penny. Need we say more?

## Twin-cylinder Two-strokes.

**C**OMPARATIVELY slow progress is being made with twin-cylinder two-stroke engines for motor cycles, mainly due to the war. This type of engine, however, is considered by many leaders of the motor cycle movement bound to loom large in the public purview in years to come. The specimens we now see are the forerunners of a really promising type of engine, for with the complication not exceeding that of a four-stroke single-cylinder, we have prime movers equalling in firing torque four-cylinder four-stroke engines as commonly fitted to cars. Granted they are not yet perfect, for extravagance of fuel consumption and lack of flexibility are outstanding troubles of the past, but these defects will be mastered in time, and the promise is then great.

As we have previously pointed out, the necessity of a spring frame is to some slight extent counterbalanced by fitting a smooth-running, even-firing, vibrationless engine. Were all motor cycles fitted with perfectly-balanced engines *The Motor Cycle* spring frame campaign might never have been launched, but the need for increased comfort is now only too palpable to those who have need to use the badly cut up road surfaces of the present day.

## MORE SPORTING

## REMINISCENCES

FOR real "sport" there was, of course, nothing to be compared with the chequered travels of the early pioneers. My own memories go back to the earliest days, but are mostly associated with cars, as I was very young and very impecunious when motors first came in, and the early motor cycles and tricycles did not permit the bloated plutocrat to offer pillion rides to poor and jealous friends. On the sole occasion when I took a pillion ride on a prehistoric motor cycle, I stood on the back axle of a De Dion tricycle with my arms round a friend's neck for about ten yards—when we emerged from his level drive to attempt a steepish hill, the whole contraption tipped over backwards and shed us in the road. It was on the same hill a year or two later—if the editor will permit a digression into four-wheelers—that we left a Locomobile spider car standing after a trial trip. I am not quite sure how the braking machinery of the creature was arranged, but anyhow reliance was placed on a single chain which joined the engine to the back axle. While we were at lunch the American chain dissolved into its component parts, and the Locomobile sped gaily backwards down the hill and considerably damaged some very handsome iron gates lower down.

## An Exciting First Ride.

I fancy my first ride on a motor bicycle was on a front-driven Werner in the Euston Road. The surface was greasy, and the ill-balanced machine threw me off, jumped on top of me, pummelled me soundly, and ended by catching fire, as inevitably happened when you got a sideslip with tube ignition. And sideslips took some resisting with front-driven machines, and heavy engines perilously poised on the top of the back wheel. I wonder if the Werner Brothers are still alive? They sold me several machines later on; one had a dustproof carburetter, ingeniously concealed inside the tank, entry being gained by a sliding panel with sharp edges. The vaporiser was dustproof enough, but it gave trouble from other causes, and the sharp edges of its dust-proof chamber scarified my fingers and wrists till they looked as if they had been trapped in a mowing machine. I believe the same people sold me quite a modern looking 2 h.p. with flat belt drive.

A well-known lady competition rider, Mrs. Baxter, crossing a small water-splash. She is the wife of Lieut. Baxter who after a plucky bombing attack was reported missing, as stated in our issue of May 18th.

*The reminiscences of trials and doings of the past recalled by a veteran competition rider in our Spring Number of April 13th were so appreciated that we asked our contributor to continue the series. This he has done, and the second instalment, dealing more with his earliest motor cycle experiences than with actual trials, is published herewith. "Some Manx Memories," by the same writer, will appear in an early issue.*

The engine pulley was made of paper or leather washers threaded on studs, and you renewed the washers every fifty miles, though it was really the belt that needed renewing.

My first really good drive on a motor cycle was in the rear saddle of a very quaint affair. Its front end consisted of an Ariel tricycle—a genuine improvement on the De Dion, as the engine was inside the rear axle, and so far improved the balance that the front wheel did not tip heavenwards and scout for hostile aircraft unless you ran over an unusually big brick. The rear half of the combination took the form of the back part of a lady's tricycle, bolted to the Ariel axle, and known as a Whippet trailer. The owner sat in front and drove, and I was thus saved all responsibility. All went well till the sparking plug wire came off. It took us an hour to solve the puzzle. Though we found and replaced the plug terminal in five minutes, it did not occur to us that the wire ought to go under the terminal. On the way home we got ditched, for the following amazing reason. My friend imagined that you stopped the engine by applying the brakes, being ignorant of the concealed switch inside the left handle-bar grip. After a few miles the brakes became too weak to stop the engine any longer, and we met our Waterloo through taking a quick bend too fast.

The first decent motor bicycle I remember was a 1½ h.p. Phoenix ridden by J. van Hooydonk. I know now that it smelt and rattled abominably, and was a poor hill-climber; but in these days imagination could picture nothing more splendid. Hooydonk was a long way behind his orders, and I rode several French machines instead, until I got on to the 1½ h.p. Excelsior-Minerva, with a baby engine strapped with tinfoil under the front down tube (no relation of the modern Excelsior). A clever traveller had almost screwed me up to ordering a 2 h.p. Quadrant (I don't know that the engine was really more powerful than the 1½ h.p. Minerva, but it sounded better, and we were all eager for more power), when the first 2¾ h.p. M.M.C. Excelsior with an enlarged edition of the famous De Dion engines appeared. I ordered one with a forecarriage, which inspired my *début* in motor journalism. Very few people then possessed forecars, and I wrote and offered a brilliant description of my

BYGONE

Climbing Butter Tubs Pass in the 1913 A.C.U. "Six Days."

**More Sporting Reminiscences.—**

experiences to the Editor of *The Motor Cycle*, and also to the editor of a rival publication, which ceased to appear shortly afterwards. Both accepted eagerly without seeing the MSS., and I hastily took some alternative photographs, and recooked an auxiliary version of the copy. The main point about that forecar was that you took out the front wheel of the bicycle and fastened the forecar to the front down tube of the former with a single clip. Needless to say, my forecar turned round at right angles and bowed to me when I was going fast downhill. My mechanical genius was early apparent; I extended the clip till it also encircled the saddle-pillar tube; and until the clip broke both tubes I had quite a good time with the outfit, and actually drove it round Devon and Cornwall.

My next interesting purchase was a Dennis Speed King quad. Why "Speed King" I don't quite know, unless the makers had a good sales manager. The machine could not coast down River Hill at more than 25 m.p.h. owing to the awful friction in its French epicyclic gear, and if the wind were against it, it was hard pressed to average 10 m.p.h. on the level. I had long admired the machine as set out in the Dennis catalogue, but £125, its list price, was far beyond my means. However, I found one second-hand in the Euston Road on a wet Saturday evening, marked £60. I had £45, three months' wages, in my pocket, and an hour later I emerged from the emporium at the helm of the Dennis. It served me well on the whole, its chief failing being a habit of shedding a vital part of the two-speed gear. When

this happened, you remained in ignorance till you came to a hill and tried to change down; then you walked back, and offered huge rewards to everybody you met for the missing part. It had really three speeds up hill: one, low gear in, with both passengers aboard, say 6 m.p.h. and range very limited; two, low gear in, front passenger walking behind pushing; three, low gear in, both passengers pushing.

**Sad to Relate.**

Soon after this quad left me (I forget what happened to it), I blush to say I became something of a shamateur, until I saw the error of my ways. I bought my machines for cash, and criticised them freely in the public press; but I often figured in competition on special machines readied by the trade. For example, my manager informed me one Friday that he had entered me in three classes at a certain hill-climb. Would I please ride my own machine to the venue, when I should find something very hot in charge of his foreman? I duly arrived at the venue, to find an excited throng of officials and competitors hustling each other and arguing. Pushing my way into the heart of the scrimmage, I found the local inspector arguing with my manager's foreman, who was standing guard over a row of three racing machines, each bearing the same registration number, and that the number which adorned my own bicycle. The foreman appeared to be getting the worst of it, and I was careful to secrete myself and the very incriminating fourth machine until the sky had cleared. I regret to add that I was not placed in any of my three classes.

VETERAN.

**A NEW ITALIAN SIDECAR.**

IN illustrating Italian-built motor cycles from time to time we have commented upon the obvious growing influence of British design upon the productions of Italy. Further proof of this point is to hand in the accompanying illustrations of a new 8 h.p.

Bianchi. One glance will show its great resemblance to British design in general, and in particular to the Sunbeam. This 8 h.p. Bianchi is, we understand, an experimental model, and the photographs were taken during a recent test on the St. Bernard Pass.

The engine is an 8 h.p. M.A.G. Other features are all-chain drive, three-speed countershaft gear, and hand-controlled disc pattern clutch.

# Occasional Comments by "Ixion"

## Carriers on Rear Sprung Frames.

The manufacturer who changes his specification usually finds himself confronted with more than he expected, and this common fate has obviously befallen one or two who are experimenting with spring frames. For example, technical motives may lead you to pivot your rear springs on a point situated somewhere down the saddle-pillar tube. In that case, you will probably find it convenient to hitch your carrier tubing to the same pillar. High carrier clearance may then be forced upon you; and when the entire frame design has been plotted out, you may find you have to hoist your saddle several inches in order that it shall clear the raised carrier. At this point you start to redesign the rear frame, and curse *The Motor Cycle* for denouncing rigid rear frames.

## Enthusiasts on the Rampage.

I have lately received two letters, one from an F.N. owner in New Zealand, the other from a British Scott devotee, and both were simply sizzling with appreciation. The Colonial brought out a point of some interest to designers. Belt drive he regards as useless in countries where water-splashes abound, and where creeks and floods are not uncommon. Chain drive is equally handicapped where the dust is deep, gritty and abrasive; if naked, it needs new sprockets sooner than we need new chains in England; if encased, the cases are useless after a few tumbles—and tumbles are the daily lot of the bush-track rider. But if he chose his F.N. because of its encased shaft drive, he appears to love it on every score. A further point of interest in his letter is that it keeps cooler than twins and singles do in the same climate; obviously, a four-cylinder has a greater radiating fin area in proportion to its cubic capacity than the ones and twos possess. This should be weighed by designers of Overseas models, especially those intended for the tropics. My Scott correspondent bases his enthusiasm for two-strokes on the absence of valve chatter, evidently possessing an ear which can stand the burble of exhaust gas, but is offended by any mechanical noise whatsoever. Also he prefers the Scott to all other two-strokes, because it is vibrationless at high road speeds, whereas the baby usually gets into something of a tantrum when asked to exceed 30 m.p.h.

## From Salonika.

The same post brought me an interesting dissertation from an officer at Salonika on the respective merits of the "square" and long-stroke engines. He has evidently been digesting Capt. Lindsay's opinion of the long-stroke Norton, and wonders why so many makers use a stroke which is only fractionally longer than the bore. I fear I have never heard a qualified engineer discourse on this topic, but I have always imagined that the long-stroke engine was hardly a machine for duffers, because its elongated connecting rod administers a fearful thump to the bushes when the engine is badly handled, and allowed to konk

round a corner, or whilst pounding a bad gradient after an awkward start. The long-stroke single creates a delicious sensation of getting down to its work, when it is properly handled; but if a fool manhandles it, its bushes are comparatively short-lived. I dare say most motor cycle manufacturers would agree with Carlyle as to the proportion of fools in the population; and hence their adherence to the "square" engine is not surprising.

## Fast Stretches.

Correspondents of *The Autocar* have been reminiscent on the subject of the fastest stretches of public road in the country, and amongst others the following lengths have been cited: (1) Great North Road, Boroughbridge and Catterick; (2) Hartford Bridge Flats on the London-Basingstoke road, now rather pot-holed; (3) Bath Road, Reading to Newbury; (4) Banbury-Oxford road, Deddington to Kidlington; (5) a stretch between Bath and Stroud; (6) part of the Witney-Cheltenham road; (7) Aylesbury to Banbury.

Some years have elapsed since I scrapped any part of the End-to-end route, but averages of over 30 m.p.h. for over thirty consecutive hours are not practicable without the aid of natural speed stretches, and I particularly remember a patch somewhere between Lancaster and Carlisle; another near Tarporley; and a third a few miles north of Truro, where some three miles about midway between Bodmin and Truro always struck me as a magnificent place for a flying sprint of two or three miles. Some of these stretches are only familiar to me in the small hours, when one is apt to gamble on nothing emerging from side turnings; riders who know them at all hours may state that it is unsafe to scrap them as a rule. Any other claimants? When all is said and done, the bit of road on which speed is pleasantest is the Carter Fell route into Scotland from Corbridge north. That part of Watling Street makes a beeline for miles, straight over all obstacles, and if its switchback character does not make for record times, the steep dips and rises make pace more exhilarating than it can ever be on the dead level. Here a car should not be used, as the next dip is usually blind, and one cannot always tell whether a second car may not be rushing up to meet you in a narrow road; but it is perfectly safe for speed motor cycling, and when the surfaces happen to be good, forms a most joyous little trip on a fast machine. I once got 60 m.p.h. out of a Ford somewhere near Crieff, in Scotland—by speedometer, *bien entendu*, on a particularly open bit of broad and slightly falling road; and even the Ford people would not want to censor my reference if I add that there wasn't much of that Ford left when we got back to town. It only hit the ground about once every ten yards, and really proceeded in a series of sighting hops, like a nervous kangaroo. If the Scots send in any fast stretches, I fancy there are one or two up Caithness way which are not exactly slow.

## THE SOURCE OF THE THAMES.

A Week-end Trip to Cheltenham.

WE have spent an exceedingly pleasant week-end on a 3½ h.p. P. and M. sidecar of the type supplied to the Royal Flying Corps. Our destination was Cheltenham, from which place we made small excursions. Cheltenham is a point which is exceedingly well situated as a touring centre, lying as it does on the edge of the Cotswolds, close to the range of which Birdlip Hill forms a part. It is also within easy distance of the Wye Valley and the Stratford-on-Avon district.

One of the most interesting spots near the town is Seven Springs. It lies just off the road from Cheltenham to Cirencester, which road, by the way, runs direct to the top of Birdlip. Father Thames, the most important river in the British Isles, both from an historical point of view and also from the fact that it carries more traffic than any other in the United Kingdom, if not in the world, first sees daylight in a very unpretentious manner. Any one passing along the road in a car or on a motor cycle is likely to miss the Seven Springs altogether unless he notices the name inscribed upon a signpost at the road

(Left) The tablet on the wall on which there is the Latin inscription marking the birthplace of our national river.

(Below) A corner of Seven Springs where Father Thames first saw the light.

junction. There is little or nothing to indicate its presence, merely a hollow at the roadside, rather charmingly situated among the trees, but somewhat muddy to approach. At the bottom of the hollow is a pool of clear water into which the Seven Springs issue. The pool drains underneath a wall into a charming lake one can just see through a barred window, and over this window is an inscription in Latin verse: "*Hic tuus O Tamesine pater septemgeminus fons*" ("Here, O Father Thames, is thy sevenfold spring").

In its early course the Thames goes by the name of the River Churn, or Isis, which latter name, as well as Thames, is preserved at Oxford, but after flowing through the University town it is generally given the name by which it is better known.

During our brief stay at Cheltenham the P. and M. acquitted itself exceedingly well, and climbed all the gradients to which it was put in the locality with remarkable ease. The engine, we noticed, was well balanced, and certainly

the whole machine lived up to its reputation of extreme reliability.

## Imports and Exports Both Increase.

IT is rather astounding at first to find upon turning to the Board of Trade returns for May that the number of motor cycles imported during that month is slightly more than that of the previous month. This surprise, of course, is due to the prohibition of imported motor cycles for pleasure purposes, which was made law some time ago. But machines for which deposits were paid on or before March 27th can be imported, and undoubtedly the greater part of the 361 received during last month come into this category. A few are probably sidecarriers, and there is no ban on such vehicles.

It is gratifying to see exports on the increase, and if only the difficulties, to which we have on more than one occasion referred, be removed, they would increase still further. Still, the value of the export is over £26,000 more than it was in April.

The following are the actual figures:

### IMPORTS.

	May, '16.	April, '16.	May, '15.
Number ... ..	361	349	1,496
Value, complete machines ...	£15,511	£14,279	£16,982
„ tyres and parts ...	£9,532	£17,810	£17,218

### BRITISH EXPORTS.

	May, '16.	April, '16.	May, '15.
Number ... ..	895	626	858
Value, complete machines ...	£41,437	£29,487	£36,667
„ tyres and parts ...	£38,429	£24,105	£28,554

### Imports of Petrol.

10,348,789 gallons of petrol were imported into this country during May. The amount in April was 8,190,910 gallons. It should be noted that duty has been paid on 11,069,959 gallons for May, the assumption being that the difference in the two amounts has been taken out of bond.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Advanced Ignition.

**Q.** I ride a 6 h.p. twin, and have been advised to keep the ignition lever control fully advanced whenever possible, retarding on hills when knocking occurs. I find this answers very well, but is it correct, or does it race the engine? Also, does riding with the spark advanced tend to make the engine run hot or otherwise?—W.F.H.

The method of driving, as regards the ignition lever, is perfectly correct. The farther you can advance the spark, within limits, the more likely are you to keep the engine cool.

### Lighting Dynamos.

**Q.** I lately bought in Auckland a Royal Enfield combination fitted with Lucas dynamo, etc. Within a month the cells have swollen one-third more than the proper size. I think the trouble is that as there is no governor on the six volt dynamo, the cells are being charged more often with an eight volt current. My reason for thinking this, apart from testing with a meter, is that I get twice the light with the engine running that I do when lighting from the accumulator only.—D.F., Te Aroha, New Zealand.

We submitted this question to Messrs. Lucas, who reply as follows: "We duly received your favour, with enclosure from 'D.F.' complaining that the cells of the lighting set fitted to his Royal Enfield combination have swollen considerably. This is certainly abnormal, and is the first case of this kind brought to our notice. If you will suggest to 'D.F.' that he communicate with us direct, giving instructions for despatch, etc., we shall be pleased to replace the battery free of charge. The following hints may be useful to your correspondent: As regards the lamps burning more brightly when the dynamo is on, this effect is produced when there is a bad or broken connection in the main dynamo battery circuit, causing the dynamo to be direct on to the lamps. For the bad connection, inspect the sidecar plug, and make sure that all the contacts are good, and if the plug is a loose fit in the hole, open out the plug at the slot with a knife. Also inspect

battery terminals, and make sure of good contact. Another cause of the trouble is bad contact at the control brush on the commutator of dynamo, or at the terminal connections of control brush. The 'governor' which the owner speaks of is in this machine an electrical device, and involves a third brush placed about midway between the two main brushes. It is essential that this brush should be making good contact on the commutator, otherwise the output of the dynamo will increase in relation to the speed, and overcharging will ensue, also increase in voltage at the lamp terminals when the dynamo is running at high speed. To prove whether either of the above faults is causing the trouble, carry out the following test: Remove all lamp plugs, switch into lamp position on the switchbox, and run the engine at high speed. The fuse inside the switchbox should then 'blow out.' It is easy then to find the bad contact whether in the control brush or in main dynamo battery circuit if the test proves its presence. If bad contact is discovered, rectify; and try fuse test again to make sure. One of the most important instructions is that which emphasises the necessity of seeing that all contacts, whether at battery terminals, sidecar plugs, dynamo brushes, or switchbox are tight."

### Difficult Starting.

**Q.** Would you be kind enough to help me out of a little difficulty? I have a 3½ h.p. fixed engine motor cycle, and I have a terrible job to get the engine going, having to run the machine up and down the road for a quarter of an hour or twenty minutes sometimes before I can get it to fire. The magneto is in first-class condition, also the sparking plug. I have had the carburettor down and cleaned it, and cannot find anything wrong with it. I have tried the air and throttle levers in different positions, but it does not make any difference.—H.G.H.

The trouble is almost sure to be due to air leaks at the induction pipe or carburettor unions; possibly, also, to a worn air slide. For starting you want a small quantity of mixture but a fairly strong one. Perhaps you have been trying to economise with petrol too much, and have too small a jet.

### Gear Ratio and Consumption.

**Q.** I am considering the purchase of a new 3½ h.p. motor cycle and sidecar, and, having used motor cars, I find this difficulty occurs in this lighter vehicle. Over bad roads the machine will not travel slowly enough on its top gear. Under no circumstances do I wish to travel over 25 m.p.h. Would it be wise to have the gear reduced? Would lowering the gear increase the petrol consumption? The top gear at present is 5.25 to 1.—L.R.

You might have the gear reduced slightly, especially if you do not wish to exceed 25 m.p.h. With the existing gear the machine ought to travel slowly enough. The trouble is probably due to the fact that the carburettor is not adjusted for slow running. Lowering the gear would raise the consumption to a small extent.

### Back Cylinder Refuses to Fire.

**Q.** I shall be grateful if you will help me to solve the following difficulty with the magneto on my 3½ h.p. Douglas. On a few occasions the back cylinder refused to fire when I attempted to start my machine from cold. In every case I took out and cleaned the plug, and sometimes injected some petrol to make sure that the cylinder was getting a proper charge. There was sparking at the plug. After I ran a couple of hundred yards the back cylinder suddenly fired and then the machine went without further trouble. Recently I found the same old trouble. When I was running on one (front) cylinder I touched the compression tap and the tappet, and at just that moment I felt a nasty shock; the right hand was on the handle-bar. Do you think the fault is due to the carbon holder? The trouble seems to occur only when the engine is cold.—T.S.

As the trouble only occurs when the engine is cold, it is quite possible it might be due to carburation and not to the ignition at all. An air leak, a sticking valve, or any defect of that kind would account for the symptoms of which you complain. You might look at the carbon brush, and if it is at all glazed, just rub the glazing off with a very fine file, or with a little fine emery paper.

**Irregular Running.**

**Q** I have a 1911 Douglas. A week ago the engine played all sorts of tricks—kicking, stopping, and then racing. My brother and I took it to pieces, and we found everything all right. Now, after re-assembling it, we find that it will not pull so well as a 1910 Douglas, which takes two up. I have come to the conclusion that the timing is the trouble. Can you tell me how to time it? At present the exhaust valves close at the top dead centre, and the engine fires just before the top of the stroke, with the spark lever advanced one-third.—H.E.H.

So far as we can make out the timing is perfectly correct. It is quite possible that the trouble may be due to the carburetter; either there is a bad air leak, or the petrol pipe or jet is partially stopped up. Are you sure, also, that the inlet valves are working well, that their springs have a more or less equal tension, that they open to the same degree, and are not unduly worn? These are points which should be checked.

**Timing.**

**Q** I shall be glad if you would give me your opinion of the following trouble with my  $3\frac{1}{2}$  h.p. twin J.A.P. engine. For several months it has been running well, but about a week ago it pulled up sharply on a slight gradient, and there was spitting back through the carburetter. On examination I found that a nut which holds the pin on which the front cylinder cam wheel runs had come off. To get this on, the guard and chain of the magneto drive had to be removed. I also removed the cover of the timing case and checked the position of the timing wheels; these are correct. On re-assembling I found the power had gone altogether, except on a gradient. The magneto and carburetter are both in good order and clean, and the valves operate well. Is this timing correct? With the magneto practically fully advanced, the plug sparks with the piston right at top of the compression stroke? This is how it is timed at present. I may add that advancing or retarding the magneto has practically no effect on the engine speed, even when running free. The spark at both plugs is very healthy. I cannot fathom the trouble, as it came on so suddenly, there being no gradual dropping off in power. I tried short-circuiting first one and then the other of the cylinders on the stand, but both seemed to be pulling the same. Both cylinders are getting well oiled.—R.E.M.

Evidently the timing wheel for the spark is timed too late. This accounts for the loss of power. The magneto should be timed so that with the spark two-thirds retarded the points of the magneto contact breaker are about to separate with the piston at the top of the stroke.

**The Reason for a Hollow Gudgeon Pin.**

**Q** Would you kindly inform me whether there is any reason for a hollow gudgeon pin in a two-stroke engine, or whether it is only for lightness? One of these motor cycles recently developed a blow back, which I traced as follows: As the gudgeon pin passes the inlet port the compressed gas in the crank case rushes out through this pin, consequently there is a great loss of power together with an abnormal consumption of petrol. As there does not appear to be any wear in the pin, I am thinking of stopping the ends of the hollow pin by means of a brass bolt through the pin, with leather washers to keep it gastight, unless, of course, there is a reason for the pin being hollow. If so, there is no alternative but to have a new gudgeon pin fitted.—W.R.H.G.

The reasons for a hollow gudgeon pin are lightness and ease of lubrication. You could safely plug up each end with brass, provided there was a tiny hole to allow the adequate lubrication of the small end. Leather washers are not required.

**Economy and Utility**

NUMBER.

**JUNE 29th, 1916.**

\*\*\*\*\*

**The Fitting of Piston Rings.**

**Q** I recently ordered some piston rings for an 8 h.p. motor bicycle, and was told by the firm from whom I ordered them that they should be fitted without a gap when the cylinder is cold. This caused me considerable surprise, as I always understood from your valuable journal that the rings should be fitted with a gap of, say,  $\frac{1}{16}$ th of an inch, to allow for expansion and to prevent seizure of the piston. Will you kindly let me know what is the procedure of the best manufacturers? I presume that the firm considers that the cylinder gets heated quite as much or more than the rings, and consequently expands equally with it. This may be so at the top of the stroke, but at the bottom of the stroke that portion of the cylinder in contact with the rings at this point would be cooler than the rings. Please state the maximum temperature in the cylinder and the expansion of cast iron ring  $10\frac{1}{2}$  in. in circumference.—E.J.H.

There should be a gap of, say,  $\frac{1}{16}$ th of an inch when you fit the piston ring. This is the usual practice. The maximum temperature in the cylinder with a compression of, say, 75 lb. per square inch will be about 400° C., the expansion of iron being roughly about 1 mm.

per foot. It is obvious that the bottom of the cylinder would be cooler than the top, owing to its being farther from the point where the explosion takes place.

**Protection for the Eyes.**

**Q** Can you recommend a suitable pair of goggles for a one-eyed rider which will obstruct the view as little as possible? Something is necessary to protect the eye from flies.—L.F.K.

We think that the celluloid guards made in one piece would meet the case most satisfactorily. These are not exactly goggles, and do not curtail the view to the same extent. They can be bought from all dealers.

**RECOMMENDED ROUTES.****NORTHAMPTON TO TILSHEAD, WILTS.—O.**

Northampton, Blisworth, Towcester, Brackley, Oxford, Faringdon, Swindon, Beckhampton, Devizes, Tilshead. Approximately 100 miles.

**CHESTER TO HARROGATE.—J.A.**

Chester, Frodsham, Warrington, Wigan, Preston, Whalley, Clitheroe, Gisburn, Skipton, Harrogate.

**WORCESTER TO SALISBURY.—C.K.**

Worcester, Tewkesbury, Gloucester, Stroud, Nailsworth, Bath, Wolverton, Warminster, Wilton, Salisbury.

**RUGBY TO MARLBOROUGH.—A.B.**

Rugby, Dunchurch, Southam, Banbury, Chipping Norton, Burford, Lechlade, Highworth, Swindon, Marlborough. Approximately 85 miles.

**SHEFFIELD TO LLANDUDNO.—J.A.P.**

Sheffield, Grindleford Bridge, Eyam, Tideswell, Buxton, Macclesfield, Knutsford, Northwich, Chester, Mold, St. Asaph, Rhyl, Llandudno. Approximately 130 miles.

**CHISLEHURST TO LYME REGIS.—F.G.S.**

Chislehurst, Bromley, Beckenham, Elmers End, East Croydon, straight across the main road until you join the tramlines leading to Carshalton; Sutton, Cheam, Epsom, Leatherhead, Guildford, Hog's Back, Farnham, Alton, Alresford, Kingsworthy, Winchester, along the Southampton road to Basset, Shirley, Totton, Ringwood, Wimborne, Bere Regis, Dorchester, Bridport, Lyme Regis.

**MIDDLESBROUGH TO EXETER.—F.J.T.**

Middlesbrough, Stokesley, Thirsk, Boroughbridge, Wetherby, Aberford, Doncaster, Tickhill, Worksop, Mansfield, Nottingham, Long Eaton, Isley Walton, Whitwick, Coalville, Hinckley, Coventry, Warwick, Stratford-on-Avon, Evesham, Winchcomb, Cheltenham, Stroud, Nailsworth, Bath, Chewton Mendip, Wells, Glastonbury, Bridgwater, Taunton, Wellington, Cullompton, Exeter. Approximately 360 miles.

**PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.**

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the import of paper material by always having their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

# "THE MOTOR CYCLE" RECRUITING SECTION.

M.M.G.S. and H.S. M.G.C. closed to Recruits until Further Notice.

Change of Central Office for R.E. Despatch Riders.

This section was instituted with the sole object of assisting readers and directing them to the many different branches of the Army and Navy, for which their special knowledge suited them. At the outbreak of war numerous letters reached us (and continue to arrive) from men at home and overseas possessed of motor engineering knowledge, explaining their difficulty in obtaining particulars of Specialised Sections (notably the Motor Sections), recruiting officers being invariably occupied by the demands of the line regiments. The Editor is Inspecting Officer for the M.M.G.S., Heavy Section, Machine Gun Corps, and R.E. Despatch Riders. Throughout, the work has been purely honorary, and Recruiting Commissions have not been accepted. To date 9,820 readers have taken advantage of our proffered assistance.

IT was announced in our last issue that recruiting for the Motor Machine Gun Service and also the Heavy Section, Machine Gun Corps, had closed for the time being. The short notice was unavoidable, and based upon telegraphic instructions received. Many readers have been disappointed, it would appear from correspondence which continues to flow in.

At Coventry on Tuesday last week, a goodly number of experienced men presented themselves, and the Editor was able to make special arrangements for the men to be sent on to Birmingham by warrant, in order to be tested for the Royal Flying Corps, which is open for men of most R.F.C. trades, as well as car drivers. All the men were trade tested by the special R.F.C. recruiting party in charge of Lt. Goode, and those found proficient accepted for that popular branch of the service.

Next day, at Manchester, Mr. Geoffrey Smith received telegraphic instructions to select a score of the most experienced men for the Motor Machine Gun Service, and a list is given hereunder:

Albinson, B., Hollinwood.  
Butler, J., Heywood.  
Chambers, H. W., Bangor.  
Crappier, E. R., Bamford.  
Davies, W. R., Rochdale.  
Dunsmuir, K. M., Hale.  
Entwistle, J. S., Darwen.  
Frankland, A., Guiseley.  
Garlick, J., Clitheroe.  
Gent, F. A., Brooklands, Manchester.  
Hutcheson, T., Newcastle-on-Tyne.  
Kelsey, F. R., Manchester.  
Mawson, J., Otley.  
Moorcroft, H., Manchester.  
Richardson, T., Newcastle-on-Tyne.  
Robinson, T. W., Middlesbrough.  
Sawyer, G. H., Bradford.  
Shaw, M. G., Kendal.  
Swarbrick, J. W., Chorley.  
Thornton, G. R., Clay Cross.  
Wild, G., Rochdale.  
Young, F. D., Cheadle.

Readers should note that there are no immediate vacancies in the M.M.G.S. and the H.S. M.G.C., but when further men are required an announcement to that effect will appear in these columns. Meanwhile, it should be noted by practical men that the A.S.C., M.T., as well as the R.F.C., require recruits.

Applicants accepted at the beginning of last week prior to the notice to close recruiting include:

Fowke, C. E., Stafford.  
McGhie, W. I., Coventry.

## ENLISTMENT OF DESPATCH RIDERS.

OWING to the introduction of universal service the work of the Central Office, Motor Cyclist Reserve Com-

mittees, has practically come to an end. In future all applicants for enlistment as motor cyclist despatch riders, R.E., from the London district and Overseas, should apply direct to the O.C. Dunstable Signal Depot, R.E., Dunstable, Beds. Applicants from other districts should for the time being apply to the Secretaries of their local motor cyclist Reserve Committees, a revised list of which is as follows:

HOME COUNTIES DIVL. AREA.	Rev. F. W. Hassard Short, 3, Watling Street, Dartford.
EAST ANGLIAN DIVL. AREA.	Capt. R. Wilson, O. i/c Administrative Centre, Ashburnham Road, Bedford.
IRISH COMMITTEE.	Lt. J. D. Weir, Headquarters, Irish Command, Parkgate, Dublin.
NORTHUMBRIAN DIVL. AREA.	Major P. S. Harrison, Drill Hall, Hutton Terrace, Sandyford Road, Newcastle-on-Tyne.
NORTH MIDLAND DIVL. AREA.	Capt. H. L. Wheeler, D.S.O., 2, Market Square, Stafford.
WEST RIDING DIVL. AREA.	Lt. C. W. Wilson, 63rd Divl. Cyclist Co., Babworth Camp, Retford.
HIGHLAND DIVL. AREA.	Capt. John Stuart, 8, Kin-nould Street, Perth.
LOWLAND DIVL. AREA.	Major A. A. McBean, R.E., 21, Jardine Street, Glasgow.
SOUTH MIDLAND DIVL. AREA.	Sec.-Lt. H. Smith, R.E., 6, Brynland Avenue, Bishops-ton, Bristol.
WELSH DIVL. AREA.	
WESSEX DIVL. AREA.	Capt. W. McD. Allardice, Army Inspection Dept., Armoury Road, Small Heath, Birmingham.
EAST LANCASHIRE DIVL. AREA.	Capt. E. H. Wray, R.E., Depot E. Lancs. R.E., Old Trafford, Manchester.
WEST LANCASHIRE DIVL. AREA.	Mr. S. W. Philpott, 22, Rodney Street, Liverpool.

## Appreciation of the Army Council.

In a letter to Mr. T. W. Loughborough, secretary of the Auto Cycle Union, who has been responsible for the work of the central office during the last six months, the Army Council states that it is "cognisant of the good work done by the Auto Cycle Union in the past, and much appreciates the results which have been obtained as regards the recruiting of motor cyclists."

Mr. Loughborough has also received a letter from Col. R. H. H. Boys, expressing thanks.

## THE ADAPTABLE MOTOR CYCLE ENGINE AGAIN.

WE are able to present our readers with another instance of a motor cycle engine successfully doing work for which it was never intended. In this case it is a Rudge 3½ h.p. engine that is used for driving the belting of a bayonet cleaning machine in Egypt. It was taken from a motor cycle that was badly damaged at Gallipoli, and we are told that it is doing well in its new sphere. The big flywheel, on the left in the photograph, was taken from an old pump standing in the market place at Alexandria, and a groove was cut in the wheel for the belt. Twelve emery and leather wheels and huffs are driven in this manner. The photograph has been sent by Staff-Sgt. Wright, at present in Egypt with the Army Ordnance Corps, who, we understand, was responsible for the arrangement.

THE ADAPTABLE MOTOR CYCLE ENGINE.

A 3½ h.p. Rudge motor cycle engine driving machinery for cleaning and sharpening bayonets.

## NEW ALLON MODELS.

Road Trial and Details of a Remarkable Twin Two-stroke Machine made by an Old-established Birmingham Firm. The Latest 4 h.p. Four-stroke Alldays-Allon.

THE appearance of a new two-stroke machine of the single-cylinder type is nothing unusual nowadays, there being different makes innumerable, but the twin-cylinder machine has been left severely alone by most makers, and it remains for a few firms, given to much experimental work, to introduce a novelty of this kind.

Messrs. Alldays and Onions, of the Matchless Works, Birmingham, have now in course of manufacture an excellent model of the twin type. Their lightweight single two-stroke Allon needs no recommendation. It is very well-known, and when it is said that the new twin incorporates all the workshop and road experience gained with the lightweight, coupled with the usual first-class workmanship which characterises the products of this factory, it will be readily understood that the new model is a really good thing. There are practically no additional complications, and it is in effect merely a doubling of the single-cylinder with necessary alterations to details.

### The Engine.

Following the usual Allon practice, the two cylinders and the upper half of the crank case form a one-piece casting, in itself a clever piece of work. Each cylinder is of the three-port type, bore 70 mm., stroke 76 mm., the pair giving 584 c.c., and rated at 5 to 6 h.p. Two separate inlet ports are placed close together at the back of the engine between the projections in the casting which form the transfer ports, and are covered with one inlet manifold. Easy access to the transfer ports is provided by two openings, with plate caps and bolts adjoining the inlet ports. The exhaust ports are also covered by a one-piece casting, provided with cooling fins, and leading to a single pipe and silencer

The Allon crankshaft from two aspects, with balance weights attached.

Detachable crank case with phosphor bronze bushes in place.

with an extension pipe having a flattened end. Lubricating ways are provided in the casting, the oil being fed to a central point, and then diverted to either side to the main bearings.

The crankshaft is a good piece of work, being formed in one piece with four internal flywheels, these being in addition to the usual outside wheel. Balance weights are bolted to the inner side of the flywheels. The crankshaft bearings, which run in phosphor-bronze bushes, are of generous dimensions, and no compression leakage need be feared either at this point or at the joint of the under half of the crank case with the main casting. Special attention is paid to this joint. No washers are used, perfect

metal-to-metal surfaces being relied on. The cranks are very neatly made, the web being drilled to reduce weight. Pistons are of the usual two-stroke type with deflector head, two top rings only, and usual type of gudgeon pin.

The two release valves are operated by a double lever controlled by Bowden wire from an ordinary lever on the handle-bar. To prevent overheating, always a serious question in two-strokes, and particularly those with twin engines,

the radiating fins on this engine are ample, a clear air space being formed between the two cylinders. And here it may be noted that, though the machine was run in "free" at varying speeds from normal to high for a space of over five minutes, it yet showed no signs of distress, and would have run no doubt for a much longer time without trouble.

### Other Features.

The engine unit is the principal item, but there are other features worthy of note.

Transmission is by heavy chain to a three-speed countershaft gear box, and thence by lin. belt, over large pulleys, to the usual belt rim. The clutch is of the cork inset type, controlled by grip lever and Bowden cable from the left handle-bar alongside the valve release lever.

The front brake is band applied, and works in a V rim. The rear brake is on car lines, internal expanding metal-to-

General view of cylinder casting and crank case of the new 5.6 h.p. two-stroke twin-cylinder Allon.

metal, operated by foot lever, the drum and braking surface being of generous dimensions. The magneto is the E.I.C., but the carburetter is not settled upon. Mudguarding is well looked after, and a neat guard over the top of the belt rim will no doubt go far to keep the belt free of mud. If we may offer a suggestion, it is that a good wide undershield, preferably in one piece with the leg shields, would add to the general appearance, and effectively combat the mud nuisance. Wheels, tyres, tank, etc., all are of good type and need no comment.

**New Allon Models.—**

We were not able, in the time at our disposal, to make an exhaustive test on the road, but a short trip on the outskirts of Birmingham served to show the Allon's paces, and, despite the fact that, like the usual works test machine, it had been severely handled with a consequent loss of tune, yet it easily pulled a heavy sidecar and a twelve stone passenger at a speed which was quite fast enough for safety. A speed of 30 m.p.h. was easily maintained at half throttle, and its limit is probably in the neighbourhood of fifty miles per hour. The exhaust produces a remarkable drone, not excessively loud, and like nothing else but an aeroplane engine, the unusual note attracting attention; it was amusing to come across people staring into the sky, and to see their surprise on finding that a motor cycle was the cause of the familiar hum. Our run included one hill of fair gradient, about 1 in 9 or 10 at the steepest part

The 5-6 h.p. vertical twin-cylinder two-stroke Allon, which is described in the accompanying article. The cylinder capacity is 584 c.c.

The new 5-6 h.p. Allon as a passenger machine. Robust construction, neat design, and excellent mudguarding are points that appeal to one in glancing at this picture.

for 200 yards, of no real value as a test hill, but sufficient to demonstrate the engine's climbing power. The climb was not so fast as expected, partly on account of being baulked half way up, and partly from the want of tune before mentioned. Still, it left no doubt of the way it could climb, and this bill, as well as many other stiffer propositions, have been taken easily on top gear at well over the legal limit with sidecar and passenger, whilst the reserve gears enable the machine to climb any main road gradient.

**Easily Managed and Controlled.**

The handle-bar clutch control was particularly useful in traffic dodging, and the machine is practically no more difficult to manage than an ordinary two-stroke lightweight. The kick starter is very efficient, and the engine never once failed to start at the first kick. It is fairly economical; sixty miles per gallon can be obtained with the sidecar attached. Only a few test machines are running at present, but the model will be on the

market almost immediately; in fact, a number of the first orders are about to be completed, and in a few weeks time many of these interesting machines will be seen on the road. To the man who hankers after the simplicity of the two-stroke lightweight, coupled with the reserve power necessary for sidecar work, it is just the thing. We are hoping to give this machine a more exhaustive test in the near future.

**Other Models.**

Messrs. Alldays' other models are the single two-stroke lightweight Allon and the four-stroke 4 h.p. single-cylinder Allon. The latter is a well-designed mount, sturdily built, with plenty of reserve power, 86 mm. bore, 95 mm. stroke. The frame has a sloping top tube similar to the lightweight model, and it gives a very comfortable riding position. Transmission is by chain to a three-speed countershaft gear, and thence by 1in. belt. The handle-bar-controlled clutch and kick starter make for easy control, and the braking system is most efficient, the back brake being of the internal expanding type. The equipment generally is first-rate, and the whole goes to form a very attractive solo or sidecar mount of the "go anywhere" kind.

The big single-cylinder four-stroke 4 h.p. Alldays-Allon. It is provided with the popular chain-cum-belt drive and countershaft three-speed gear. The engine dimensions are 86 mm. x 95 mm. = 552 c.c.

## TIME TO LIGHT LAMPS

"SUMMER" TIME.

June 15th	...	...	9.46 p.m.
" 17th	...	...	9.47 "
" 19th	...	...	9.48 "
" 21st	...	...	9.48 "

### A Surrey Road Warning.

Several members have recently reported to the Automobile Association the existence of a control between Ewell and Epsom, at Half-mile Bush.

### Fast Times in California.

At Fresno, California, a five miles race for amateurs was won by J. H. Hess on a Harley-Davidson in 5m. 32s. E. Tice, also on a Harley-Davidson, won the club race over the same distance, his time being 4m. 27s.

### Stolen Machine.

A new Ryder-Jap machine was stolen from Messrs. Rider Troward and Co., of Hampstead, last week. It was a 1915 model, fitted with Albion two-speed gear box, Senspray carburetter, Dixie magneto, Dunlop and Avon tyres. The registration number was 1T 364, but this may have been altered.

### Another Wounded Soldiers' Outing.

The owner of an Enfield sidecar, Mr. Alfred Taylor, of 81, High Street, Thornton Heath, has for a long time been taking out wounded convalescent soldiers from various hospitals in Croydon and the adjoining neighbourhood. Prompted by our successful Belgian wounded soldiers' outing, organised just a year ago, which was the first of its kind, and by the excellent example of the Harley-Davidson Motor Co., Mr. Taylor has requested us to help him organise an outing of a similar nature.

The idea is to assemble beneath the clock close to Thornton Heath Station in High Street, Thornton Heath, at 2 p.m. on Wednesday, July 5th. Being an Enfield rider, Mr. Taylor hopes that as many owners as possible of this make of machine will turn up, but, of course, riders of any make will be heartily welcomed. Every rider is requested to bring a spare coat and a pair of goggles for his passenger, and also to stand the expense of entertainment, which should not exceed 1s. The destination suggested is the Brambletie Hotel, Forest Row, where tea will be served. This makes an exceedingly pretty run, and it is hoped that as many sidecar owners as possible, to the number of, say, thirty or forty, will put in an appearance. Those willing to attend should send in their names to *The Motor Cycle*, marking the envelopes "Red Cross"

## SPECIAL FEATURE

THE ACTION OF A TWO-STROKE ENGINE SIMPLY EXPLAINED.  
MORE SPORTING REMINISCENCES.

### "Summer Time" Means Fewer Accidents.

A London coroner, Mr. S. Ingleby Oddie, says that since daylight saving has been in force there has been a marked diminution in the number of street accidents.

### A New Index Mark.

Motor vehicles registered in Middlesex from now onwards until further notice will bear the index letters MC. The letter H was first assigned to Middlesex, being followed by MX.

### The Pressman's Friend.

In the effort of daily newspaper men to find the quickest means of getting copy and photographs to headquarters, the motor cycle has been used with great success. Some typical instances where newspapers have been enabled to secure "scoops" by means of the handy two-wheeler will be given in the Special Economy and Utility Number of *The Motor Cycle* to be published a fortnight hence.

### The A.C.U. Touring Guide.

Owing to the war no new touring guide is being published this year by the Auto Cycle Union, but a twenty-eight page supplement to the 1915-1916 guide, pub-

lished last July, has just been issued. The information given in this supplement brings the 1915-1916 guide completely up to date. Perhaps the most useful information it contains is a map showing the restricted lighting areas in England and Wales. We all hope that another year such a map will not be necessary.

### Officer Charged with Stealing Motor Cycle.

A second-lieutenant in the Royal Fusiliers was charged at Dover on Friday last with stealing a motor cycle and jewellery. The officer had been sent home suffering from shell shock, and upon promising to refund the losses he was bound over.

### Motor Cycling in Queensland.

We often chronicle the doings of motor cyclists in Western Australia, Victoria, N.S.W., and South Australia, but seldom anything is heard about the pastime in the great north-eastern State of the Commonwealth. There is a motor cycle club of Queensland that holds regular competitions, though as a result of the war these have been reduced in number. A reliability trial was held recently, the winner being N. G. McNeil (3½ h.p. Rudge).

### THE MOTOR CYCLE IN INDIA

A young Sirdar, a grandson of the Gaekwar of Baroda, being introduced to the delights of motor cycling. The outfit is a Harley-Davidson, and the driver is Percy W. Johnson, formerly a member of *The Motor Cycle* advertisement staff. Mr. Johnson (who writes from Allahabad) says that at present one rarely meets an Indian riding a motor cycle, but there is every indication that the numbers who do so will increase rapidly.

**Recruiting Changes.**

Simultaneously with the closing of the M.M.G. and H.S., M.G.C., for recruits, the Central Office for despatch riders has been changed.

**Petrol Readily Obtainable.**

During a trip to Manchester on recruiting work last week we experienced no difficulty in purchasing petrol at garages *en route*. Our experience is that the shortage is much exaggerated in certain quarters.

**A Rare Photograph.**

A picture on page 568 shows the late Rear-Admiral Sir R. K. Arbuthnot, said to be the only photograph taken of him in naval attire during the past fifteen years, though photographs showing him on a motor cycle, such as appeared in our biography last week, are numerous.

**War Time in Germany.**

Surely we are not so badly off as Germany? The photograph on this page, taken in Berlin, may dispel many illusions. Petrol, it appears, can be spared for powerful pacing motor cycles, and the attendance at the cycle race meeting proves that sport is still indulged in. The people do not strike one as "starving," whilst the summer apparel would show that necessities are not really lacking.

**Petrol Supplies.**

The latest in regard to the petrol position is outlined in this issue. A census of petrol stores and the requirements of motor users was to be taken this week. Many people have been led to suppose that motoring is to be prohibited, but such fears we deem to be groundless. Certainly "pleasure" motoring, what little exists nowadays, may be restricted by limiting petrol supplies, but we do not suppose for an instant that a ban will be placed upon motoring. Motors are too much a part of our daily life to be dispensed with, without causing an entire dislocation.

**A Hundred Miles Road Race in South Australia.**

The Motor Cycle Club of South Australia, Adelaide, ran a successful long distance road race on Easter Saturday, April 22nd. The course was a circular one, starting near Stansbury, and two laps and twenty-four miles made the century. There was a time-limit of three and a half hours.

Results are as follow:

**CLASS I.—Up to 350 c.c.**

		h.	m.	s.
1. A. Limb (2½ Douglas) ..	..	2	53	56½
2. J. H. Gilbert (2½ J.A.P.) ..	..	2	56	9½
3. A. E. J. Klose (2½ Douglas) ..	..	2	56	39½

**CLASS II.—351 to 600 c.c.**

1. W. A. Driver (3½ Norton) ..	..	2	19	35½
2. W. H. Hubbard (3½ Norton) ..	..	2	32	45½

**CLASS III.—601 to 1,100 c.c.**

1. C. E. Nalty (7-9 Indian) ..	..	2	1	19½
--------------------------------	----	---	---	-----

**CLASS IV.—PASSENGER UP TO 600 c.c.**

1. L. S. Eglinton (3½ Kent sc.) ..	..	3	8	5½
------------------------------------	----	---	---	----

C. E. Nalty put up a particularly good performance, as, besides making fastest time, he was the only competitor to have no involuntary stops; he only stopped for petrol and oil.

After the race members of the club held a carnival and concert, the result of which was that £45 was handed over to the local Red Cross fund.

**The National War Funds.**

At the week-end the principal relief funds stood as follow:

The Prince of Wales's National Relief Fund	£5,901,515	0	0
(distributed) ..	£3,318,000	0	0
Fund for the Sick and Wounded	3,854,355	0	0
Tobacco Fund	108,186	10	8
Queen's Work for Women Fund	169,564	10	7

**A Fast Half-mile in Western Australia.**

A Douglas rider, O. Parker, has recently covered the flying half-mile on Lake Perkolilli, W.A., in 28½s. (63 m.p.h.). This, we are informed, is a local record for the 350 c.c. class, the previous best being held by a Sunbeam rider. We have already referred to Lake Perkolilli; it consisted originally of a salt lake, but the red soil from the surrounding hills has gradually drifted over its surface, and this, combined with the salt of the lake itself, has produced a most smooth surface.

**Motor Cycle Taxation.**

A correspondent this week takes motor cyclists to task for their opposition to the proposed taxes. Amongst other things, he says that the man who sells his outfit because of an extra £2 per annum is "cutting off his nose to spite his face." This may be true in some cases, but what about the man who simply cannot afford the extra tax, which may amount to as much as £3 14s. 6d.? Many a motor cyclist would cheerfully pay a double tax, as our correspondent says he intends to do on a light car, for he knows the country requires money. What motor cyclists in general object to is the unfairness and unsuitability of the proposed taxes. It is true that everyone at home ought to be willing to make any sacrifice for those at the Front, but why should one class be singled out to make sacrifices which are beyond their means?

**The Working of a Two-stroke Engine.**

In response to several requests, we give in our centre pages this week an illustrated explanation, in untechnical language, of the operation of a two-stroke engine. A similar description, but dealing with a single-cylinder four-stroke engine, was published in *The Motor Cycle* of March 9th.

**Where the Australians obtain their Motor Cycles.**

Together the six States of the Australian Commonwealth spent in 1915 £103,558 on motor cycles. Great Britain did by far the greater part of the business, motor cycles and parts being purchased from the Home country to the amount of £74,660. The United States came next with £28,438. Unless international affairs assume a different shape much quicker than appears the 1916 figures, we are afraid, will not be quite so favourable to England.

**War Time Repairs.**

Motor cyclists requiring any part of their machines repaired by the manufacturers should take care to find out before despatching the machine or parts whether the firm are in a position to undertake the repairs. We recently heard of a motor cyclist whose two-speed gear had gone wrong. He immediately despatched the gear to the makers. After a few days he received a notice from the firm to the effect that, as they were entirely on Government work, they could not undertake the repair. They therefore refused to accept the gear when delivered by the railway company, the result being that the gear was left lying at the railway station for some time until instructions for return were sent. This caused a delay of more than a fortnight before the repair could be done locally.

**WAR-TIME RACING IN BERLIN.**

A scene at a circular track during a pedal cycle race, the competitors being paced by motor cyclists. The wounded soldiers on the right will be noticed. This photograph may dispel popular illusions. (See paragraph.)

THE MOTOR CYCLE.

## THE ACTION OF A AN EXPLANATION IN SIMPLE LANGUAGE OF

**I**N our issue of March 9th we gave a description and illustrations of the working of a four-stroke motor cycle engine for the benefit of beginners. As lightweight two-strokes are rapidly becoming more and more popular, and their riders are very frequently absolute beginners, we consider it would not be out of place to give a description in simple language of the working of these little engines for the benefit of this section of our readers.

The two-stroke engine, as its name implies, is one which completes its cycle in two full strokes of the piston, and, differing from the usual four-stroke engine, an explosion is obtained every revolution of the crankshaft. As everyone

the cylinder wall through which the gases pass, and they are covered and uncovered by the piston. The usual type of two-stroke engine is that which has three ports, viz., inlet, exhaust, and transfer. The two former are self-explanatory, while the transfer port and passage are a passage and port through which the fresh charge is transferred from below the piston to the top.

The arrangement of the ports on nearly all two-strokes is as follows: The exhaust and inlet ports are usually situated together, in order that the hot exhaust gas shall warm the fresh charge and render better evaporation possible, while the cool incoming gas prevents excessive heat from accumu-

Fig. 1.

*Piston at top—charge fully compressed—spark igniting charge—exhaust port closed—transfer port closed—inlet port fully open—fresh charge rushing into crank case to fill partial vacuum caused by upward travel of piston.*

knows, in order to obtain one impulse four separate operations have to be performed by every type of petrol engine, viz., induction, compression, explosion, and exhaust. In order to obviate four separate strokes of the piston, as in the four-stroke engine, both sides of the piston of a two-stroke are utilised to pump the gas, the top half performing the compression and explosion operations, while the under half draws the gas from the carburettor and pumps it into the cylinder ready to be compressed, the exhaust being left, so to speak, to look after itself, leaving the cylinder partly by its own pressure and partly by the pressure caused by the fresh charge being forced into the cylinder by the crank case compression. These engines have no valves in the ordinary sense of the word. In their place ports are cut in

Fig. 2.

*Piston descending—inlet port closed—transfer port closed—exhaust port just beginning to be uncovered by piston—exhaust gas commencing to leave cylinder under its own pressure—fresh charge in crank case under partial compression.*

lating in the neighbourhood of the ports. However, in whatever position in the cylinder these ports are placed they will be similar as regards the travel of the piston. The lower lip of the exhaust port will be level with the bottom of the piston when at the bottom of its travel. The inlet is situated at a slightly lower level, so that it is not uncovered completely until the piston has reached the high point of the upward stroke. It will, therefore, be seen that the exhaust port communicates with the cylinder while the inlet when uncovered communicates with the crank case. The transfer port is placed on the same level as the exhaust port, but always on the opposite side of the cylinder wall and is usually a rather more shallow opening, the reason being that, although when the piston is at its low

# TWO-STROKE ENGINE.

## WORKING PARTS AND CYCLE OF OPERATIONS.

ent, both transfer and exhaust ports are wide open. The exhaust opens slightly before the transfer, and enables a greater proportion of the burned gas to escape before the transfer port is opened. It will be noticed that the piston top is not flat, but sloping, and with a ridge on the transfer port side. This ridge is known as the deflector, its action being to deflect the fresh gas in an upward direction on its entering the cylinder, thus preventing it from intermingling with the burned exhaust gas which is passing out the exhaust port on the opposite side of the cylinder. There being no exhaust valve, provision has to be made to release the compression for starting purposes. It is,

the meantime the piston in its upward travel has caused a partial vacuum to be formed in the crank case. It will be seen that upon the piston reaching the top of the upward stroke the inlet port has been uncovered, the result being that a fresh charge of gas rushes into the crank case to fill this partial vacuum. It should be noticed that the lower portion of the piston covers both the exhaust and transfer ports during the whole of this upward travel of the piston.

Figs. 2 and 3. The spark having taken place, igniting the gas, causing it to expand violently, the piston is forced in a downward direction, rotating the crank and at the same time partly compressing the new gas which has been drawn

*Piston fully descended—exhaust and transfer ports open—fresh charge, indicated by black arrows, being forced up transfer passage and deflected in an upward direction by deflector—remainder of exhaust gas being expelled, assisted by pressure of fresh charge.*

before, necessary to fit a small mushroom-headed valve the cylinder, through which the compression may be released when necessary. This will be noticed in the illustrations, situated in the cylinder head.

The general construction of a two-stroke engine is very similar to the four-stroke, only very much more simple. A great feature of a two-stroke is, as previously mentioned, the absence of valve mechanism or timing gear.

The sequence of operations is as follows (assuming that a charge of gas has already been forced into the cylinder): Fig. 1. In this illustration it will be seen that the piston has travelled in an upward direction, compressing the gas in the cylinder, ready to be ignited by the electric spark at plug upon the piston reaching the top of its stroke. In

*Piston commencing to rise—fresh charge in cylinder being compressed—partial vacuum being formed in crank case—all three ports closed.*

into the crank case. Upon the piston nearing the end of its stroke (fig. 2), the exhaust port is uncovered, and the burned gas commences to rush out into the silencer and thence into the air. Upon the piston reaching the end of its downward movement (see fig. 3) it has uncovered the transfer port, upon which the compressed gas in the crank case is forced up the transfer passage and so enters the cylinder. It is deflected in an upward direction by the piston deflector, and so prevented from following the exhaust gas out of the exhaust port. Incidentally, the pressure of the incoming gas assists in forcing the remainder of the exhaust out of the cylinder.

Fig. 4 shows the commencement of the up stroke, and the sequence of operations is repeated.

## THE PETROL SUPPLY.

A Modified Priority List sent to all Garage Owners and Petrol Dealers.

THE absorbing topic, next to the war, at present among motor cyclists is the petrol question.

The Petrol Control Committee appointed by the Board of Trade continues its deliberations, and beyond the priority scheme of supply nothing definite has been announced. Restrictions there may be in the future, but reports of the stopping of motoring altogether for other than war workers in one form or another are entirely erroneous.

Last week we published on page 541 the priority list for the distribution of petrol as arranged by the Petrol Control Committee. Since then a special distribution sub-committee has been formed consisting of representatives of the principal motor spirit importers. This sub-committee has circularised all garages and petrol dealers, giving instructions as to the preferential supply of petrol, and a priority list (the former one modified) has been included in the letter.

TO GARAGES AND DEALERS IN MOTOR SPIRIT. ORDER OF PRIORITY FOR DISTRIBUTION OF MOTOR SPIRIT.

Dear Sir(s).—Acting on instructions received from the Petrol Control Committee, we beg to inform you that the following list of customers, whom you may be in the habit

The late Sir R K. Arbuthnot, Bart., C.B., M.V.O., taken at Newcastle when he was in command of H.M.S. *Lord Nelson*. Great gratification was expressed when the *Gazette* of last Friday announced that the appointment of Sir Robert to the order of Companion of the Bath had been antedated to May 30th. Admiral Arbuthnot's appointment, being one of the Birthday Honours, was originally dated June 3rd, three days after his death in the naval battle.

A Cape Town reader, Foster Black, who has joined the Union forces as a despatch rider for the German East African Campaign. We have already announced that latest pattern  $4\frac{1}{2}$  h.p. countershaft B.S.A.'s are being used for this campaign. Foster Black's civilian mount is an Iver Johnson, an American make little known in England, on which he is seen above.

of supplying, are entitled to and must receive preference in supply:

CLASS A.—Includes requirements for or by—

Lords-Lieutenant, High Sheriffs, and any services certified by a Government Department to be essential.

The carriage of munitions of war or materials for munitions of war.

Medical practitioners.

Fire Brigades and ambulances.

Motor cars used by or under the authority of the Red Cross Society or the St. John Ambulance Association, or any other society approved by the Admiralty, or Army Council for the conveyance of wounded or sick members of any of His Majesty's Forces.

Police and Local Government authorities.

Veterinary surgeons.

CLASS B.—Includes requirements for or by—

Agricultural machinery.

Motor cabs plying for hire.

Motor cars used by commercial travellers for business purposes.

Stationary engines (including lighting sets).

Motor fishing, cargo, and passenger boats other than boats running pleasure services.

We have therefore to request you to carry out the Committee's instructions, which are essential in the general interests of the country, and your failure to assist in this matter can only result in other steps being taken which may greatly interfere with the welfare of the trade generally.

Needless to say, petrol left after the above needs have been satisfied is for the use of motorists using their cars and cycles for necessary recreation.

At the time of going to press no definite date has been decided on which to take the proposed census of petrol, though it was rumoured a few days ago that it would be one day this week. When definite arrangements have been made official announcements will be made in the daily press, and all users will probably have to obtain forms from post offices on which to fill in their individual requirements.

## SIDE-CARRIERS FOR THE RUSSIAN ARMY.

### LARGE ORDER OF BRITISH MACHINES.

**W**E recently had the pleasure of inspecting the first batch of most business-like sidecarriers, representing a portion of a much larger consignment of similar vehicles being supplied by Messrs. Humber, Ltd., for the use of the Russian military authorities. The outfits consist of the 6 h.p. horizontal water-cooled twin motor cycles, which have most substantial sidecar chassis attached, supported on very heavy springs, and carrying large box bodies. The lids open in two halves. The outfits are finished entirely in khaki, every part being painted.

The mechanical details of the machines are as on the standard horizontal twin-Humbers; water-cooled cylinders, three-speed gear boxes, and handle-starting through the 2 to 1 gear. Entirely enclosed chain drive is used, and in order to lessen the harshness of the drive at slow speeds a shock absorbing device is arranged in the rear driving sprocket. The thermosiphon water cooling is most efficiently carried out on these machines, and the radiator, which is of ample size, is carried immediately behind the steering head, and has a capacity of one gallon.

Small car type Claudel-Hobson carburettors are fitted, the control, therefore, being of the simplest, as the throttle lever is all that has to be attended to, while the pilot jet fitted ensures a tilt over when running in "free." The rear wheel brake is most powerful, an extra large shoe working on the inside of the V of a special belt rim on the right-hand side of the wheel. Druid pattern spring forks are used.

### HUMBER SIDECARRIERS FOR THE RUSSIAN ARMY.

The illustrations show only the first batch of a large order that the famous Coventry firm has received from the Russian Government. A 6 h.p. horizontal twin-cylinder water-cooled engine provides the power.

Besides the Humber machines that have been supplied to the Russian Army and illustrated herewith, we are informed that a consignment of two-stroke single-gear Coventry Eagles have also been delivered to the same Government. British motor cycles are also favoured in France, and quite recently the French War Office has added a number of 4 h.p. Sun-Jap machines to the Flying Corps.

### MOTOR CYCLING BEATS FLYING.

Lt. F. M. C. Houghton, R.F.C., who was the joint secretary of the successful B.M.C.R.C. Services meetings last year, has been transferred from the Cyclists' Battalion to the Royal Flying Corps. His experiences are quite interesting. "It is now a month," he writes, "since I forsook the saddle for the observer's seat, and I like the work well enough. The first time up was not in the least what I imagined it would be.

"In my own opinion, motor cycling beats flying all along the line, because you do realise you are moving when you can see the earth slipping away underneath. Of course, this is an observer's point of view."

# THE TREDELECT LIGHTING DYNAMO.

## A Simple and Inexpensive Means of Lighting a Motor Cycle.

THE adoption of self-contained electric lighting systems has naturally been slower on motor bicycles than upon cars, where the bulk of the apparatus and its weight are of less importance. A new type of lighting dynamo, specially built for motor cycles, has, however, been recently manufactured by the Tredelect Engineering Co., of 11, Linden Arcade, High Road, Chiswick. The machine is designed to retail at three guineas, which includes the cut-in, but does not include the accumulator or the lamps. Its output is rated at  $3\frac{1}{2}$  ampères at 4 volts, which suffices for the lighting of a head lamp, side lamp, and tail lamp, and is therefore adequate for a sidecar combination. The outside dimensions of the dynamo are  $4\frac{1}{4} \times 3\frac{1}{4} \times 6\frac{1}{2}$  in. long, and its total weight is about 8 lb. One of its distinctive features is that, unlike the car lighting dynamos of the same make, which run

Wiring diagram of the Tredelect motor cycle lighting dynamo.

on ball bearings, it is fitted with bearings of a special quality of carbon, similar to that used on large steam turbines. Prolonged tests have proved these bearings to be perfectly satisfactory, provided that no oil is put upon them. Steam or water does them no harm at all.

The accompanying sketch shows in diagram the wiring system of the Tredelect dynamo. The machine itself is of the simple shunt-wound variety. It is fitted with a special regulator to prevent its output becoming too high at big engine speeds. One of its principal features is the cut-in, a fitting which is more commonly called a cut-out.

### The Method of Wiring.

In the diagram it will be seen that the current flows from the positive terminal of the dynamo A to two coils or solenoids S S, which are wound round soft iron cores magnetically connected across one end by an iron yoke. Across the other end, but not touching, is a hard steel armature, which, of course, becomes a permanent magnet with poles opposite the two solenoids. The movement of this armature is controlled by a spring, and the end of the armature carries loosely the pivoted carbon block shown at P C in the diagram. The spring of the armature is so set that when the voltage of the dynamo is sufficient to overcome that of the accumulator, the armature is pulled up between the solenoids, and the pivoted carbon P C forms a junction between the two fixed carbon blocks C1 and C2. The current from the dynamo, instead

of having to return to the negative terminal through the field coils F, is then able to travel also round the outside circuit to the accumulator B and lamps H and T. If subsequently the speed drops so that there is any tendency for the accumulators to discharge through the dynamo, a point is reached at which current ceases to flow through the coils S S. Just at this moment the armature moves away, and the outside circuit is broken. There is, of course, no sparking, because at the instant there is no current flowing. Consequently, the carbon surfaces remain perfect for an indefinite period without needing any attention.

The whole dynamo is very well constructed with a view to complete reliability without necessitating any attention, and at the same time with the object of keeping down cost. There are no soldered connections on the armature, which can therefore stand a big overload, and the special features of the cut-in certainly form a strong recommendation for the system. We have not tested it on the road, but, after careful examination, we believe the instrument to be one which promises to be thoroughly successful.

### FRONT HUBS.

#### A MUD-EXCLUDING DEVICE USED AT "THE FRONT,"

ON March 30th we published some particulars and illustrations showing how motor cycle manufacturers make their front hub weather-proof. The accompanying illustrations were sent to us from the Front by E. M. Oliver, and show his method of excluding dirt. This, we understand, has been adopted by many D.R.'s, and has proved most effective. The device simply consists of a disc of tin about 8 in. in diameter, and dished by being cut half way across, the edges then being soldered together, with about  $\frac{3}{16}$  in. overlap. The hole in the centre should be an exact fit on the dust-excluding cap, and the two should be soldered together. With such an arrangement

Section showing disc in position. Note how the mud is kept from the bearings.

Disc ready for fitting.

it is obvious that the dirt which runs down the front forks and stays will not be able to gain access to the bearings; on the other hand, it prevents the fitting of a speedometer, but this is of no importance to despatch riders.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Rear Admiral Sir Robert K. Arbutnot, M.V.O., C.B.

Sir,—No words of mine can adequately describe the grief that is shared by all British motor cyclists at the loss of this gallant officer. But only those who were privileged to meet him in competition or to sit with him in committee can fully realise what manner of man we have lost. They need no words to remind them of his character as a sportsman, his early appreciation of the joys and possibilities of the motor cycle, and the charm of his manner.

It was at a dinner of the Auto Cycle Union, so far back as 1910, that Sir Robert fearlessly referred to the German peril, and advocated the military value of the motor cycle. Events have indeed proved the wisdom of his words. And now that he has made the great sacrifice, let us see to it that his loss shall not have been in vain.

T. W. LOUGHBOROUGH.

SECRETARY, AUTO CYCLE UNION.

#### Paraffin as a Fuel.

Sir,—The following gives the general principles of an idea for adapting the ordinary motor cycle carburetter to the use of paraffin, and in respect of its novelty may possibly prove of some interest to your readers. I have, however, unfortunately, had no opportunities for carrying out a practical test, and should be glad to get into communication with anyone having facilities, and who is interested in the subject.

In regard to the employment of paraffin as a fuel in the ordinary carburetter, I assume the principal objections to be as follow:

1. Poor degree of vaporisation (leading to incomplete combustion and its attendant evils), carbonisation, and wear and tear of bearing surfaces.
2. Difficulty or impossibility of starting from cold.
3. Variations in mixture, due to the effect of varying temperatures and atmospheric pressures in cylinder and vaporising chamber on the vaporising point of the fuel.

My idea is intended to obviate these three difficulties. The other objections to paraffin, such as overheating and engine knocking, detonation of charge, etc., are probably inherent in the nature of the fuel itself, and must be met by structural alterations in the engine.

Briefly, I propose inserting in the induction pipe of the carburetter, and immediately over the jet, a fine mesh gauze made from platinum wire, insulated from the metal by means of a fibre ring, and ending in two insulated terminals. Through these would be passed from a battery (kept charged from a small lighting dynamo) a current of electricity sufficient to maintain the gauze at a temperature about the normal ignition point of the fuel. Upon the induction stroke the fuel being violently sprayed through the hot gauze should be completely vaporised into a form ensuring complete combustion and easy starting from cold. The period of time between the induction strokes in a four-stroke engine should be sufficient to counteract any cooling of the gauze as a result of the spray.

At high speeds the effects of increased temperature of vaporising chamber and decreased pressure over jet would begin to appear in a lowering of the vaporising point of the fuel, and this I propose to counteract by the inclusion in the circuit of a mechanically operated rheostat so arranged as to reduce the resistance, and therefore the temperature, of the gauze in proportion as the engine speed increases.

H. A. BROMLEY.

Sir,—Perhaps you will find at least a portion of the following sufficiently interesting for publication.

I have covered to date this year 2,310 miles on petrol-paraffin mixtures, varying from one-fifth paraffin to three-eighths paraffin, the latter being the most I can use without noticeable difference in running. I have used this proportion for the bulk of the mileage, and have very little fault to find with it. The saving is, of course, considerable, as the mixture works out at only about 2s. to 2s. 2d., according to the price paid for the paraffin. I find it pays to use the best paraffin obtainable, either White Rose or Royal Daylight, which I carefully strain before using. I also find that a small portion of engine oil in the mixture assists in a decided manner in obtaining complete vaporisation. This, I am well aware, is often used

An extra air device.

on overworked sidecar machines (mainly singles), but I have not yet seen anyone mention it as an aid to paraffin consumption.

My mount is a 6 h.p. Zenith, direct drive (76 x 8 J.A.P.), fitted with Amac carburetter, jet 29. Of course, all sorts of jets have been tried, but I find anything larger than the above tends to overheating. As a preventive of this, and also an aid to lubrication, I run with only one piston ring in the front cylinder and two in the back, and find no loss of power, whilst the pistons being well drilled (three rows in each piston,  $\frac{1}{2}$  in. holes), I am able to keep up a good average speed without any of the drying up I previously experienced when the machine was driven at all hard.

I am indebted to an article you recently printed by Mr. J. W. G. Brooker, who quoted a tip used on his Rover, which I have found beneficial in another form. This was to insert pins in the previously enlarged holes over the jet (Amacs only). I had not the means available for accurately enlarging the holes, as recommended, but instead passed a short length of wire in and out of the holes, as shown in the lower sketch. (A single strand of an old Bowden cable is ideal.)

I next tapped a small hole in the inlet pipe, into which I inserted a small gas tap about 1½ in. long. On to this

Splitting up the fuel.

I fastened a small toy trumpet, and bent it downwards to the back of the front cylinder. The tap is kept closed for starting, but once warmed up can be left open permanently, and is particularly useful as an air brake when coasting downhill with the throttle shut. I have fitted copper gauze over each of the inlet ports, my object in fitting it there instead of the more usual fitting close to the carburetter being to catch any particles of foreign matter which may get through the hot air tap referred to.

Knocking was very easily brought about immediately paraffin in any quantity was used, so I re-timed the magneto, giving only a very small lead (about 5 mm.), but find that there is no decrease in speed, and the power on hills has increased enormously, although the previous timing was quite satisfactory for pure petrol.

My consumption is 60-63 m.p.g.—not remarkable, I agree, but very satisfactory in view of the cost of the fuel used,

and it could be increased considerably if I were content with low average speeds, which I am not. This is a point which I think should always be borne in mind when calculating m.p.g. I have, on pure petrol, with the help of the above fittings, driven 38½ miles with sidecar and passenger on a measured half-gallon—77 m.p.g.—which, I think, is exceptional.

In conclusion, I would add that I decarbonised at the end of 1,470 miles (average usual distance when using petrol), and found the deposit of the same consistency as when using petrol, the quantity also not being excessive. I have proved to my own satisfaction that the use of petrol-paraffin mixtures is quite possible, if a little trouble be taken. The inlet pipe is covered with thick felt, and afterwards well wrapped with insulating tape. CP 450.

#### Spring Frame Design.

Sir,—I have followed with interest your remarks on sprung frames, and enclose a design I am thinking of fitting to my machine which may interest you.

R.J.B.

Another spring frame design. (See letter from R. J. B.)

#### Repairing Overalls.

Sir,—In reply to your correspondent "Magister," I should recommend him to obtain some prepared canvas, as used for mending the inside of cycle tyres. If it is used in the same way as he would use it on a tyre, he should have no difficulty in mending his overalls. I have such a patch which has stood good for over twelve months.

W. DICKINSON.

#### Four-cylinder Motor Cycles.

Sir,—As one who has studied the 5-6 h.p. F.N. motor bicycle rather closely, may I give the following hints re tuning. There is no doubt that this machine is capable of wonderful results, in connection with which my machine has the following to its credit:

- (1.) Starts at a walk.
- (2.) Speeds up to 65 m.p.h.
- (3.) Petrol consumption less than a gallon per 100 miles on straight runs.
- (4.) Fierce acceleration.
- (5.) Practically vibrationless at all speeds.
- (6.) Wonderfully steady on grease.

It was evident from the first that the chief causes of trouble were the automatic inlet valves and the automatic (?) carburetter. Automatic inlet valves are very bad practice in a "four," since if one valve sticks it is sure to cause the cylinder affected to fire back into the carburetter and upset all the other cylinders. To obtain perfect results it is therefore necessary to see that the valves work perfectly freely and do not get choked with burnt oil. By bevelling the top edges of the pistons it was found that the tendency to get oil into the inlet valves was almost entirely removed. In order to get the inlet valves to operate freely at all speeds these were lightened somewhat and fitted with double springs. The way in which this was done is illustrated in the sketch. The lighter spring A had a strength of about 1 lb. for an opening of about ⅜ in. At this point the collet engages with the second spring B, which compresses a further ⅜ in. under a force of about 10 lb. This scheme enabled the valves to open freely at low speeds, and at the same time permitted high speeds to be obtained. It also practically eliminated wear on the cotters and their slots.

These modifications enable me to be sure that the inlets always function correctly, and the springs last indefinitely. No doubt mechanical inlet valves would enable more power to be obtained, particularly at low engine speeds, but apart from this I doubt if these could be of much advantage.

It is hard to understand how the F.N. Co. has continued the use of its automatic carburetter for so long. The idea

is very pretty on paper, but in actual practice the mixture is often much too strong or too weak. If the engine ran at constant speed it might be possible to arrange the choke tube variation just to compensate for the varying volumetric velocity of the air intake due to opening or closing of the throttle. As the engine does not run at constant speed one gets an over rich mixture when running fast down hill on a small throttle opening, also a very weak one when climbing slowly with a wide open throttle. Again, when accelerating, the choke tube is enlarged before the machine has gathered speed, so that the mixture is too weak, and when closing down the petrol is sucked wastefully out of the jet by reason of the choke tube being reduced before the machine has slowed down. In addition to the above, the necessary adjustment of the range of the choke tube area to suit various weather conditions is largely a matter of guessing and by no means easy to carry out. Finally, the design of the variable choke tube is far from perfect even for one engine speed. The fitting of an extra air port above the throttle is obviously a makeshift improvement, and at once disposes of single-lever control.

In view of these facts, I decided to make a double lever arrangement for controlling the choke tube and throttle independently. This was done by carrying the choke tube pinion on a hollow spindle and passing the throttle spindle through this. A remarkable improvement resulted. Whereas previously the mileage per gallon has been variable from 50 to 70, it immediately rose to at least 100. Acceleration was immensely improved, and the engine kept wonderfully free from carbon deposit. A curious fact is that, except for hill-climbing and wide changes of speed, it is found inadvisable to vary the choke tube at all, and I generally give the engine the weakest possible mixture consistent with regular firing.

In connection with the bevelling of the pistons, it was found desirable to restore the original compression ratio. This was done by taking about ⅜ in. off the bosses where the sparking plugs are fitted.

Once one understands a four-cylinder machine properly one loses interest in singles and twins. The obvious defects of snatchy drive and bad balance, which are generally found in these engines, ought to have condemned them years ago. They are even less suitable for use on cycles than on big cars, where, of course, they are now obsolete.

When will some enterprising firm build a motor bicycle with an aero type engine with four, six, or eight cylinders? It would be welcomed by L.M.

Sir,—I am sorry to say that I am more than disappointed with Mr. Thompson's reply to my request for particulars of his mechanical inlet valve arrangement for an F.N. motor.

SUGGESTED MECHANICAL VALVE ATTACHMENT FOR A FOUR-CYLINDER F.N.

The shaft H is carried in bearings E and F, cast in the induction manifold, and driven by a chain on the sprocket G. The cams A B C D are fixed to this shaft. (See letter from Freeman Lee.)

In my previous letter I did not ask for a complete treatise on tuning up my machine, for mine gives entire satisfaction as it is, excepting that for its c.c. of 498 I find that the bottom gear ratio of 7 to 1 for hilly districts is too high. If this one point were remedied so that it conformed to most low gear ratios of British machines of the same capacity, I fail to see where the advantages of mechanical valves would be with their extra complications.

At the same time I do feel that, if fitted with a mechanical valve arrangement as per sketch, it would be possible to make the F.N. engine of 498 c.c. equal to probably a 650 c.c. British engine in efficiency. This latter point, however, is for makers to develop, not riders, so at the moment I am content in lowering my gear.

FREEMAN LEE.

**An Inadmissible Theory.**

Sir,—In reference to a letter from "Ignoramus," published in your issue of June 1st, I beg to make a few observations. He asks for the opinions of others on his "theory," but I think he would have done better to have enquired a little more fully, privately.

In his expression, "The expanding charge, seeking the path of least resistance, commences to flow out of the cylinder, being assisted by the compression within," one is glad to notice that the "compression within" does at least get some credit for the expulsion of the charge. He goes on to state that the burnt gases, in virtue of their greater density compared with the incoming mixture, will tend to sink to the bottom; but why does he rush to the conclusion that "the burnt gases retained in the cylinder should be of a negligible quantity," especially as the whole transfer of the gases takes place in a fraction of a second? As a matter of fact, the burnt gases are lighter than the unburnt, therefore, if the reasoning of "Ignoramus" is correct, the burnt gases should float to the top of the cylinder, tending to let the incoming mixture escape out of the exhaust port.

It appears that "Ignoramus" made a mistake to start with, then built up a pretty but false theory, believing it himself and throwing it in the limelight for other people to believe.

I.E.F., France.

M.H.O.W., D.R.

**The Taxation of Motor Cycles.**

Sir,—I have been much surprised at the attitude taken up by motor cyclists with regard to the new taxation. Surely motor cyclists are no less loyal than other people, yet one would think so from the tone of the letters published recently in *The Motor Cycle*. I have been a keen motor cyclist for years, and so am not prejudiced. Owing to having lost a leg in this war I have had to give up the pastime, but such a hold had it taken on me that, after much deliberation, I bought a small car. I consider that my claim to possess a motor is as strong as any put forward in these letters, yet I intend to pay my double tax quite cheerfully, as I consider that we at home should willingly pay whatever is asked of us as a price for the safety we enjoy from the sacrifices of others.

A man who sells his outfit because of an extra £2 a year is "cutting off his nose to spite his face." As for the "contract" between owner and the State, by which licences last till December 31st, 1916, how about income tax and other forms of taxation? Did not an increase take place in the middle of a financial year? We are at war.

In an emergency of this sort there can be no such contracts. The money must be raised, and motorists must pay more than the non-motorist, for few, if any, motors are not used for pleasure. Everyone at home ought to be willing to make any sacrifice for those at the Front. And one more point. Do not grouse too soon—there is heavier taxation to come.

ONE WHO HAS BEEN OUT.

**Enclosed or Open Chains.**

Sir,—We have no hesitation in stating that considerable harm can be occasioned to a chain by boiling it in grease.

The temper of steel can be drawn until the polished surface of such steel attains quite a brown colour at a temperature of approximately 490° Fahr., and most greases can be brought to a temperature in excess of this without boiling.

We consider that the maximum temperature to which grease should be brought when used in connection with chain lubrication should be 300° Fahr., but we have to state that we see no reason for bringing the grease up to such a temperature. In our own plant our grease vats are heated by steam, so that their temperature is never much above 200° Fahr. This is a sufficient temperature, however, to ensure that the grease is melted sufficiently to enable it to penetrate the joints of even the smallest chains we make.

The usual recommendation we make to our clients for greasing chains is to obtain a shallow tin containing thick grease or lubricant of a depth that will ensure the chain being covered when immersed. The chain should then be coiled up so as to occupy a small space, and should be laid on top of the grease, after which heat, in the form of a gas ring or lamp, may be put underneath the tin. When the grease liquefies the chain will become immersed, and

being warm will not prevent, due to local solidification, the grease from entering the joints. Within two or three minutes after the lubricant has melted, the heating device may be extinguished, after which the chain should be allowed to remain in the lubricant until this has again solidified. The chain should afterwards be removed, and all superfluous grease on the outside of the chain can be removed with a brush or wiper.

In conclusion, we may say that to ensure the joints of the chain being satisfactorily lubricated by this process it is always advisable thoroughly to clean the chain in a paraffin bath before immersing in the lubricant bath.

THE COVENTRY CHAIN CO., LTD.

H. W. WATTS, General Manager.

**Touch Wood!**

Sir,—Your correspondent who signs himself "S.L." asks if any reader can beat his narrow escape from a serious accident. I think he will agree that the following incident, the truth of which can be vouched for by the other two officers concerned, would have given him even more cause to be thankful that he was still alive. Anyone who is acquainted with Chatham will know Cemetery Hill, which comes down steeply from Maidstone into Railway Road. A single line of trams runs on the right-hand side of the road as one is going down the hill, with a passing place about half way down the hill. I was coming down this hill on a very greasy day on a 5-6 h.p. Indian, with one officer in the sidecar, and another on the carrier. Being in a hurry to get in before lighting-up time, we were doing just over forty, and were overtaking a tram on the left-hand side. We were about thirty yards behind it when it swung in to the left at the passing place, the existence of which I had forgotten. There was a little under three feet between the side of the tram and the kerbstone—in this place nearly a foot high. It was no use swerving or putting on brakes, as the road was so greasy that in either case we should have hit the back of the tram, so I just let drive for the opening. We all leaned in to see what part of the tram we should hit, with the result that the sidecar wheel came right off the ground and cleared the kerb without touching it, and we got through without any casualty, beyond barking my knuckles against the tram. But I do not think that any of us would care to repeat the experiment!

MILITARY CYCLIST.

**Two-stroke Balance.**

Sir,—In your articles on "The Mechanics of Balancing," I find the statement (issue of May 25th, page 486): "From the point of view of balancing, a two-stroke engine is on exactly the same footing as a four-stroke, other conditions being equal."

In *The Automobile Engineer* for December last, page 344, it is said: "It is quite clear that, with the aim of retaining the full advantage of the more even torque of which the two-stroke engine is capable, the designer is confronted with the problem of balance, which does not in any case equal that of the four-cylinder or six-cylinder four-stroke engine, and, so far as the ordinary type of two-stroke engine is concerned, this disadvantage cannot be overcome."

Would it be possible to get your contributor to explain? TYRO EAGER TO LEARN.

[Our contributor's statement is quite correct; so also is the statement made in *The Automobile Engineer*. Other conditions being equal, the balance of a two-stroke or four-stroke is identical, but, with the aim of retaining the full advantage of the more even torque, the balance is sacrificed in a four or six-cylinder engine. For example, in a four-cylinder four-stroke engine four explosions occur in every two revolutions, or one explosion every 180°; the cranks are therefore set at 180°, and balance each other. In the case of a two-stroke four explosions occur in one revolution, or at intervals of 90°. Thus to retain the even torque the cranks must be set at 90°, in which position they do not balance each other. This must not be confused with the 90° V twin, in which the balance is excellent. If a two-stroke four-cylinder engine were made in the same form as a four-stroke, two explosions would occur simultaneously, and the torque would be less constant.—Ed.]

#### A New Address.

The M.L. Magneto Syndicate, Ltd., is now situated at Victoria Works, West Orchard, Coventry.

#### A Novel Head Protector.

In illustrating on page 546 of our last issue a head protector that is worn inside the ordinary cap, we omitted to state where it could be obtained. It is being sold by the Service Co., Ltd., 289, High Holborn, W.C.

#### A Wolf Mascot.

The Wulfruna Engineering Co., Ltd., Great Brick-kiln Street, Wolverhampton, has recently introduced a mascot in the shape of a wolf, designed to be attached to the handle-bars of Wolf motor cycles.

#### Injectors for the Government.

Messrs. Arthur Price, Vevo Works, Park Lane, Aston, Birmingham, inform us that they are supplying the Government with a large quantity of their three-spout injectors.

#### A Visitor from New Zealand.

We are informed that Mr. J. B. Clarkson, the well-known motor trader of New Zealand, has started on his annual pilgrimage to the old country, and that he is expected to arrive at the beginning of July. His address will be c/o Keep Brothers, Ltd., 35, Great Charles Street, Birmingham.

#### Hiring Motor Bicycles.

We are constantly asked by readers who are anxious to hire motor bicycles or motor bicycles and sidecars of a firm who let out machines on hire. Maude's Motor Mart, 100 and 106, Great Portland Street, W, inform us that they make a speciality of this kind of business.

#### Catalogues Received.

We are in receipt of a folder issued by Charles Edmund and Co., Crane Bank, Chester, describing in detail the Edmund spring frame.

We have received a folder from the Midland Rubber Co., Ltd., Ryland Street, Birmingham, dealing with their latest pattern tyres and belts, all types of which are illustrated and described.

The Bowden Brake Co., Tyseley, Birmingham, have sent us a copy of their latest catalogue, which is an excellently arranged and beautifully got up production. The motor cycle section contains all particulars of Bowden brakes, cables, control levers, etc.

The Alldays-Allon two-stroke motor cycle. Alldays and Onions Pneumatic Engineering Co., Ltd., Birmingham. The latest catalogue of the Allon two-stroke is a very fine publication. Interesting features, such as the Allon mud shields, spring forks, chain guard, gear box, and details of the new twin-cylinder two-stroke machine, are illustrated.

Fitsu Sidecars. We have received a copy of the 1916 catalogue from Fitsu Sidecars, Scala House, Smallbrook Street, Birmingham. The point of interest about these sidecars is that all models—and all tastes are catered for—are anatomically shaped to the passenger; this, it is claimed, gives a natural sitting position of great comfort.

The latest catalogue of the Levis two-stroke, Butterfields, Ltd., Stechford, Birmingham. Herein we find the popular Levis two-stroke illustrated and described. One of the excellent features of this catalogue is the series of mechanical drawings.

We also have to acknowledge the receipt of a Levis spare parts list. This again contains instructive illustrations of the management of the Levis. A particularly useful sketch shows the method of replacing the gudgeon pin, showing which side of the pin should be hit. We also are in receipt of a pamphlet entitled "Driving Instructions."

## MOTOR CYCLES FOR SALE.

## P. and M.

P.M., 3½ h.p., new August, 1914, equal new, £18; sidecar, offers.—Stevens, Goxhill, Lincs. [X1775]

1914 14½ Phelen-Moore Combination, fully equipped, almost new; bargain, £65.—Abson, 48, Kirkgate, Wakefield. [X1824]

1912 P. and M., 3½ h.p., 2-speed, wicker sidecar, good condition, recently overhauled; £35.—Chapman, Fairholme, Leighton Buzzard. [X1738]

1914 3½ h.p. P. and M., 2-speed, wicker sidecar, in perfect condition; cash or easy terms; £45.—R. E. Jones (Garages), Ltd., Swansea. [6721]

## Peugeot.

6 h.p. Peugeot and Sidecar, very fast; must clear; £18, first cheque.—C. Baker, Crowland, Peterborough. [X1875]

## Precision.

PRECISION, 4½ h.p., equal new, kick starter, 2-speed gear box, Bosch mag., sidecar, horn, lamps, speedometer, spare tyre and tube; £42.—127, Revelstoke Rd., Southfields. [6726]

## Premier.

1911 Clutch Premier, in good condition; £16; seen any time.—223, High Rd., Kilburn. [6677]

3½ h.p. Premier, 1912, 3-speed, speedometer, lamp, etc.—Hayter, 12, High St., Warminster. [6879]

PREMIER, 1913½, 3½ h.p., 3 speeds, pedal start, sidecar, economical; £30.—231, Westbourne Grove, W. [6899]

PREMIER, 1914, 3½ h.p., 3-speed, clutch, all fittings, kick start, new tyres; £35.—Box 530, c/o The Motor Cycle. [X1800]

1911 3½ h.p. Premier, excellent tyres, engine really good condition, lamp, horn; £11.—Robinson's Garage, Green St., Cambridge. [6795]

1913 2½ h.p. Premier, Bosch mag., splendid condition, good tyres; £20; seen by appointment.—Hallett, 6, Frankfurt Rd., Herne Hill, S.E. [6863]

PREMIER, 1913, 3½ h.p., Bosch B. and B., new P. Model, Dunlops, Philipson's pulley, fine running order; sell £22.—Write, 123, Bulwer Rd., Edmonton, N. [6747]

PREMIER, 1914, 3½ h.p., Mills-Fulford sidecar, 3-speed gear, spare belt, good tyres, Stewart speedometer, as new; 42 gns.—Thorogood, 305, Brockley Rd., Brockley. [6627]

PREMIER, 1915, 4 h.p., 3-speed countershaft, only done 600 miles, lamp, Long horn, speedometer, guaranteed perfect; great bargain, £45.—4, Grosvenor Rd., Aldershot. [6839]

PREMIER, 3½ h.p., free engine, H.B. controlled clutch, splendid condition; £20, for immediate sale or £23/10 with sidecar, or near offer.—Seen by appointment, owner called up.—Griggs, Folly Av., St. Albans. [6640]

PREMIER, 1912, 3½ h.p., 3-speed, an unusually fine sample, almost as new, maintaining extravagantly by late owner, good mechanically and almost new in all other details, complete; £26, great bargain.—Layton's Garage, Bicester, Oxon. [X1915]

## Quadrant.

LATE 1914 Quadrant C.B. Combination, 4½ h.p., Armstrong 3-speed and clutch, perfect condition; £38.—113, Kingston Rd., Wimbeldon. [6787]

QUADRANT, 4½ h.p., and sidecar, 1914, 3-speed, clutch, just overhauled, accessories; any trial; higher power needed; £36, or nearest.—Rhiebank, Kentish Rd., Belvedere, Kent. [6680]

1916 Quadrants, 4½ h.p. models, chain-cum-belt, £60; all chain drive, £62; these machines are fitted with B.S.A. 3-speed gear and free engine; your second-hand machine taken in part payment; generous terms, or easy payments.—Wauchope's, 9, Shoe Lane, London. [6776]

## Radco.

1914 Radco, good running order; £13; approval.—Curd, 17, Gardner St., Brighton. [6883]

RADCO, 1915, perfect, lamps, etc.; £23.—W. and H. Motor Co., Ltd., 287, Deansgate, Manchester. [6716]

RADCO 2-stroke Lightweight, Aug., 1915, perfect order; £18.—51, Gilpin Av., East Sheen, S.W. [X1854]

RADCO 2-stroke, 1915, perfect, speedometer, lamp set, overalls, and accessories; £18.—90, Pelham Rd., Wood Green, N. [6835]

RADCO (1915), 2½ h.p., 2-stroke, condition perfect, splendid climber; £20, no offers.—J.H. Serret, Mess, 4th Royal Berks. Regt., Camp 5, Windmill Hill, Andover. [X1748]

## Rex.

REX, 3½ h.p., 1913, free engine, coachbuilt sidecar; £20.—Warren's, Warren St., London. [6810]

REX, 5-h.p., and sidecar, good cover, new Senspray carburetter; £11.—Webb, 22, Cornwall Rd., [6754]

FOR SALE, 5 h.p. twin Rex and sidecar, free engine, Bosch, new tyres; £18.—Apply, 61, Bramble St., Coventry. [X1752]

REX, 5 h.p., mag., Amac carburetter, excellent condition; £15/15.—Mrs. Roskams, 58, Tranmore Rd., Earlsfield. [6737]

6 h.p. Rex, 1913, and sidecar, handle starting, lamp set, spares, engine guaranteed perfect; £25.—335, Bethnal Green Rd. [6653]

## The Petrol Census.

**M**OTORISTS generally welcome the Petrol Committee's new scheme of ensuring an adequate supply of petrol for essential needs by taking a census of supplies and requirements. If the organisation works well—and there is no reason why it should not do so—then the small quantity now required for recreative motoring should not be at all difficult to obtain, even after priority claims are dealt with. In the past, the trouble has been that the distribution of supplies was bad. In some districts there never has been a shortage, and in certain districts, we are assured, there has been an over-abundance, yet at the same time in the North Midlands petrol has been practically unobtainable by private motorists. All these difficulties in the distribution promise to disappear when the scheme is properly organised, as it should have been months ago. Then motorists, who nowadays use their vehicles for a little recreation and contribute very liberally to the Exchequer for the privilege, may motor with an easy conscience, and not feel that they may be depriving military sections of the precious fluid, as has been suggested. It is "compulsion" applied to petrol.

Anti-motorists cannot or will not see that a man is just as much entitled to buy a motor bicycle as a piano, or any other article which he needs. Precisely the same absurd reasoning is applied to petrol and theatres. Many who profess to regard motoring as unpatriotic are the most regular theatre-goers. The anti-motoring press has spread the notion that the Government would shortly prohibit motoring, and is no doubt disappointed that the move has been a tardy one, and, judging from our information, likely to remain so. Ignorant people do not realise that motor cycling is cheaper than travelling by rail, and that thousands of business men could not manage without a motor of some sort. In defence of the recreative motoring which is indulged in at week-ends

—if it needs a defence—one may cite once again the fact that motoring in the fresh air is far more healthy than spending one's money in a stuffy theatre, picture house, or, indeed, any entertainment indoors. The truth is that it is most unlikely that preventive restrictions will be placed upon motoring. Certainly petrol is not likely to be so easy to obtain as in pre-war days, but there is a reasonable quantity obtainable.

## Claims of the Sidecarrier.

**T**HOSE keen motor cyclists who have the welfare of the movement at heart must have been pleased to note the growing use of the motor cycle sidecarrier since the outbreak of war. Even before the war its usefulness was recognised to some small extent, but last year, when the shortage of horses became keenly felt due to Army demands, the sidecarrier created more marked attention. The fact that this, the most economical form of vehicle, has not disappointed the enterprising tradesman who adopted it has led to its increasing use, and this year promises to see more sidecarriers than ever on the roads. Next week's issue of *The Motor Cycle*, as already announced, will be a special one devoted particularly to the uses of sidecarriers for small tradesmen. In it we shall provide abundant evidence of the economy and utility afforded by the sidecarrier. Tradesmen are able to cover a much wider field by the aid of a faster vehicle, so bringing in more custom.

The purport of this is to appeal to our regular readers to make a point of bringing our Economy and Utility Number of next week to the notice of any tradesman acquaintances, and so help the movement and incidentally the tradesmen themselves. Enterprising shopkeepers are bound to be interested in the Number, and a little missionary work of this kind on the part of readers will be beneficial all round.

## HINTS FOR BEGINNERS.

### TUNING THE POPULAR LIGHTWEIGHT TWO-STROKE.

THE following article may be of some assistance to those two-strokers who desire to obtain the best results from their mounts. Success can only be attained by careful attention to details and being thorough in the work undertaken. Therefore it will be well to make up our minds in starting that it shall be a real overhaul, and I am certain that those who will follow out the advice given will be well repaid for their trouble by the improved running of their mounts and the feeling of greater confidence in their engines and themselves, consequent upon having made themselves more conversant with the details which go to make up the popular and wonderfully efficient two-stroke unit. Now the very fact of their simplicity in construction and the manner in which these engines will continue to go on giving out power are apt to make some of us forget to give that amount of attention necessary from time to time, and at the end of a season's running it really is necessary to go over everything in order. To start with, procure a fair-sized box into which one can put the various parts as they are taken down. First of all remove the footboards, if any, as when they are removed things become more accessible. Next remove the carburetter controls from the handle-bars, and unscrew the union of the petrol pipe at the end where it is attached to the tank, and follow this by removing the inlet pipe with the carburetter still attached, as this saves having too many small parts adrift at one time. Then put the inlet pipe bolts back in their respective places in the cylinder, thus preventing them getting lost. Now remove the compression release valve control from the handle-bars, and then the valve itself from the cylinder. The next in order will be the plug, to be followed by the complete removal of the magneto and its chain, the latter being placed in a paraffin bath; it will be advisable to wrap the magneto up and place it by itself where it can come to no harm, to be attended to later on.

#### Beware of a Cracked Piston.

Now remove the cylinder, which is a very simple matter. There is one point, however, which requires care, and that is, when lifting the cylinder off,

see that the piston is at the bottom of its stroke, as otherwise there is a possibility of the piston and connecting rod falling either backward or forward, causing the skirt of the piston to strike the connecting rod, and a broken or cracked piston may easily be the result. Put in sufficient paraffin oil to fill the crank case three parts full, and leave it there for the time being, as this will give it a chance to soak into any heavy deposits of lubricating oil that may be there. Now clean out the cylinder. This must be done in a very thorough manner; the best tool for the purpose, to my mind, is an old half-inch chisel. If this is used it will be found very effective. Turn the cylinder upside down and insert the chisel, when it will be found, by holding the handle firmly and twisting the hand to left and right, that the business end of the chisel will travel in any desired direction by simply leaning it slightly away from the direction in which you wish it to go. My own experience is that it will remove carbon quicker and more effectively than anything else I have used, while for removing the carbon usually found at the top of the cylinder wall, a quarter-inch chisel cannot be beaten, for usually this top half-inch of cylinder wall is about the most awkward part to get clean, but a quarter-inch chisel will simply charm it away. To those who do not possess these two tools I would say buy them,

as the trouble saved by their use will amply repay their cost—about sixpence each—and they can be used over and over again. Having cleaned the inside of the cylinder, take the ports in hand, and an old pen-knife will be found very useful; with this remove every vestige of carbon from the ports, and finally I would advise a polish up of the port facings with fine emery paper. It will now be necessary to remove all trace of loose carbon and emery dust from the cylinder; this can be done by washing out with paraffin and wiping quite dry with a clean rag, after which place the cylinder on one side away from dirt.

Now devote your attention to the piston. Having removed the rings, which can easily be accomplished by sliding them over pieces of tin slipped under the tips of the rings and spaced at equal intervals round the piston, place them in the paraffin along

Explanatory diagram showing the parts of a two-stroke engine which need periodical attention.

**Hints for Beginners.—**

with the magneto chain; also clean out the slots. To do this get a screwdriver with a blade that fits the slot—the one I use cost one penny—and sharpen the edge. With this it will be found a very simple matter to remove all trace of carbon, and I should like to impress upon my readers the necessity of taking care that every particle is removed, as the effect will be entirely spoiled should any carbon be left in the slots, as it prevents the rings from seating properly, and only by this means can good compression be obtained.

**Cleaning the Crank Case.**

The next item in order should be the crank case. A very good way to clean this out successfully is to use a fairly long and thin handled brush, which has stiff bristles, one such as used for Stickphast paste being quite suitable, but it will be necessary slightly to lengthen the handle by securely tying a piece of wood on to it. It will be found an easy matter to insert this in the paraffin already in the crank case and clean the inside quite well, while the big end will be quite cleaned by carefully revolving the shaft by turning the pulley with one hand and holding the piston with the other hand to prevent it getting a knock. Now remove the draining plug at the bottom of the crank chamber and draw off every drop of paraffin, and it will be well to leave the plug out for an hour or two, so that it can drain out thoroughly.

**Treatment of Piston Rings.**

You can now take the piston rings in hand, the only tool necessary for the purpose being a penknife. With this carefully scrape all deposit from both back and sides, putting no more pressure upon them than is necessary for the purpose, after which carefully wipe them quite clean and see that everything of a foreign nature has been removed. The rings may now be replaced by sliding them over the pieces of tin, but before allowing them to drop into their slots, put a liberal supply of your own brand of lubricating oil all round the inside of the slots. Now this is very important, and it is through omitting to do this that so many riders of two-stroke engines have been puzzled to account for the loss of compression after assembling their engines after an overhaul, for it is impossible to get anything like sufficient compression if the slots are dry, and it would take a considerable time for the oil to work through from the ordinary source of supply. Stuck piston rings can sometimes be traced to this cause through the oil becoming carbonised while passing between the slots and the rings in what must naturally be a very small quantity owing to the small space available when the rings are a good fit. Most piston rings are provided with small slots cut on the inside, which fit on tiny pegs in the slots; these in use prevent the rings from turning round in their slots and the ends coming together. Therefore see that the rings come properly in contact with the pegs at the time of replacing the cylinder. In the case where the rings are not pegged, see that the ends of each ring are on the opposite side of the piston to the ring directly above or below it.

**Re-assembling the Engine.**

Taking it for granted that the crank case has now thoroughly drained itself of paraffin oil, replace the

drain plug, and with an oilcan give a liberal supply of oil to the big end. A good tip in this direction is first to warm the oil, as this makes it thinner, and consequently it will penetrate further into the bearing. In the case where an engine is fitted with oil channels to the shaft end bearings, give a good supply of oil to these also. Now put some oil all round the side of the piston, treating the cylinder wall in a like manner, cut a brown paper washer to the pattern of the cylinder base, but do not forget to see that you leave a clearance for the transfer port and oilways—I have known this to be forgotten with disastrous results—and then give a thin coat of seccotine to each side of the paper, which makes a perfect joint. Carefully place the paper washer in position, and then put the cylinder on again, seeing to it that your piston rings do not move from their proper position. The cylinder can now be firmly bolted on with the knowledge that the work has been well done.

It will now be just as well to find some convenient place to knock in two nails from which to hang the carburetter-control wires and the compression release; these must be hung down quite straight where oil can be injected at the control ends, and while doing other jobs every now and then a further injection can be given, so that the inner cables will have received a good oiling by the time they are again wanted.

A. W. STANBROUGH.

(To be continued.)

"THE MOTOR CYCLE" IN EGYPT.

L.-Cpl. P. G. Burgess, despatch rider in the A.S.C.M.T., in sending us this photograph of himself pays us a compliment when he says that he looks forward to receiving the "blue cover" as much as letters from home. Since the war began we have had photographic evidence of Service readers on all the fighting fronts without exception.

## A SERVICEABLE LIGHTWEIGHT.

**S**INCE my riding consists for the most part of long distance journeys, generally made against time over mountainous roads, I have stuck with a certain degree of consistency to the big, chain-driven "single" for business purposes, finding that this class of mount stood up to the weather and the racket with a minimum of attention. It must further be confessed that hitherto I have religiously eschewed anything in the way of two-stroke lightweights for serious riding, regarding them as a class set aside for city dwellers and golfers—or at any rate as unsuitable for long distance, high speed riding over mountainous roads. Recently, however, the big single shed its sidecar while descending a 1 in 6 gradient at 40 m.p.h., and Messrs. the Headingley Motor Co., of Leeds, placed at my disposal a latest model chain-driven Levis to tide over the temporary indisposition of the four-stroke.

### A Genuine Touring Machine.

This, be it understood, was by no means a pre-arranged journalistic fest, the Levis being one of a batch just delivered for distribution, and having now ridden the machine for some days I must confess quite a new respect for lightweights in general and the Levis in particular. This individual sample of lightweight production is a genuine little touring machine, capable of standing up to the strenuous racket of commercial use, and of taking its rider anywhere that wheel grip and steerage way are possible.

On several occasions I have ridden the Levis with a view to ascertaining the full extent of its endurance, but have as yet failed to reach the limit. I have ridden it at full throttle on long mountain ascents, but only to find that it took top gear half a mile from the summit as though this were the common order of things. Immediately the gradient relaxed in the least degree a

Plan view of the chain-driven Levis, showing controls.

fast on the level. For prolonged speed it did not, of course, compare with a big four-stroke, but for nippiness and quick acceleration on hilly and tortuous roads it compared very favourably.

### Attractive Finish.

Our illustrations convey a fair idea as to the general appearance of the machine. The handle-bars are

Two-stroke chain-driven Levis. The gear is an Enfield.

## A COUNTRY RIDER'S IMPRESSIONS OF THE LATEST MODEL TWO-STROKE LEVIS.

change up was possible, and if the conditions were in any way favourable the engine would pick up in the most extraordinary manner, answering to the entire range of the throttle on the Senspray carburetter. It was, indeed, possible to change on to top gear at certain points in the gradient which would make many  $3\frac{1}{2}$  h.p. four-strokes konk.

To allude to the chain-driven Levis as a "baby" is hardly consistent. As a solo mount it belongs to a class quite distinct from the orthodox babies.

### Hill-climbing Capabilities.

The manner in which the small engine tackled stiff gradients was really precocious. Freak gradients, are not usually considered as within the range of small two-strokes, but the Levis survived several genuine freaks on which it was tested—notably Dent Hill, Park Rash, and Stake Fell. On the top of the latter the engine stopped, but not through lack of power. When will someone bring out a really air-cooled plug of sensible dimensions for two-strokes?

It is superfluous to add that with such vitality the machine proved

fast on the level. For prolonged speed it did not, of course, compare with a big four-stroke, but for nippiness and quick acceleration on hilly and tortuous roads it compared very favourably.

Our illustrations convey a fair idea as to the general appearance of the machine. The handle-bars are particularly well chosen, and convey the general sensation that one is master of the situation. It is a pity that designers of heavyweight machines—particularly sidecar mounts—do not give the same consideration to this point as the designers of lightweights. The handle-bars of many big sidecar mounts are uncom-

**A Serviceable Lightweight.—**

portable and inartistic, whereas those of the small two-stroke are uniformly good.

**The Gear and Minor Points.**

Petrol consumption worked out at approximately 90 m.p.g.

The Enfield gear is certainly an improvement on the simple dog clutch principle, but when new it appears to require judicious handling, otherwise an astonishingly rapid start is made. There are, however, one or two points I am constrained to criticise, though most of them may be consigned to the category of personal tastes. In the first place, it seemed that the footrests were too far apart for good control when it came to difficult riding. One's position was more perfect when gripping the tank between one's knees, but this meant cutting one's shoes on the inside flanges of the rests. Again, it is more restful to support one's weight on the rests if they are reasonably close together than if wide apart.

The tank fillers are of sensible dimensions, but small threads on large members are notoriously difficult to engage. After stopping at a garage for refills I found that one cap had been replaced cross-threaded by the garage boy, and it is quite conceivable that a novice would contrive to ruin the threads in a comparatively short space of time. This point, we are informed, will be revised immediately present difficulties in manufacture are removed.

One item more. As regards lubrication, we found that the most steady supply was obtained by keeping the plunger of the B. and L. drip feed clipped down,

depending on the suction of the engine, and releasing the plunger only when an extra dose was required, but since good results with a two-stroke depend largely on proper oiling, it would be as well to arrange the drip feed at an angle at which it can be seen from the saddle. The rider can, of course, readjust this for himself in a few minutes, but many riders would accept the risk of over or under oiling rather than take the trouble, *i.e.*, they would oil on the principle of "stop when it smokes and give it two when you forget." With the lubricator working automatically and visibly, one is not so much tempted to supply rule of thumb tactics.

H.M.B.

Testing the climbing powers of the chain-driven Levis on a 1 in 3 grass slope.

## CLEANABLE SPARKING PLUGS.

**W**ILL some electrician inform us whether there is any grave and intrinsic defect in the type of sparking plug constructed so that its insulator may be wholly removed from the plug body for cleaning purposes? Not long ago I was sorting my stock of old plugs and testing them in air, with the result that I put aside a couple of dozen which were in perfect order

except that their business ends were extremely foul. The lot had cost over £5 at list prices, and none of them were usable; nor could they be made so by any method known to me. Burning them out with petrol or tickling them with wire bristle brushes is all very well, but you cannot get all the dirt out of the recessed butts, and what remains serves as a magnet for more. I am now using a Forward plug which has a detachable insulator. As there are no competitions going just now, I have no real chance of determining whether it is as efficient as the hermetically sealed types, but it seems to be just the goods for two-strokes, which soil their plugs so quickly. I remember the special plug (an American importation) recommended by the Scott Co. had a detachable insulator, and the plug gap was actually adjusted by threading one or more thin washers under the insulator; which looks as if detachable insulators were good enough for some engineers. I fancy sparking plug practice is largely ruled by the car world, in which accurate oiling is the rule and compression leaks are a fearful bogey. In our world, crude oiling is the rule; microscopic compression leaks do not particularly matter, as we have no quartette of cylinders desired to purr at 80 r.p.m. in free engine and susceptible to disturbance if a cubic millimetre more air gets into one cylinder than the rest receive. So will some of the leading sparking plug makers weigh in with detachable and cleanable insulators and earn canonisation from us riders?

IXION.

**A MOTOR CYCLIST AIRMAN.**

Lt. A.S. Bucton, East Lancs, attached to the R.F.C., is a keen motor cyclist, his mount being a B.S.A.

### **Sprung Frames on Freak Hills.**

I daresay Mr. W. H. Wells will have weighed in warmly ere this, but I was one of many readers who baulked at a certain passage in Mr. G. D. Abraham's fine description of the munition workers' hill-climb at Walna Scar. He remarks that the springing of the Indian ridden by J. G. Bethwaite added to the unsuitability of the big machine for the work in hand. I am quite at one with him in his preference for small machines for this sort of fancy work; any machine is bound to curvet and skid on loose, stony surfaces, and the lighter one's mount is, within reason, the easier to correct its plunges and slides. But why does he regard springing as a handicap in mountaineering jaunts? I am asking for information, as I have not been on a real freak hill since war broke out. But if I were essaying Applecross Hill to-morrow, and were given the choice between a rigid frame and a spring frame, I should plump for the spring frame every time.

### **Automatic Carburettors.**

Is any reader sufficiently experienced in comparative carburetter design and practice to deny or confirm a suspicion of mine? It so happens that during the last six months I have been sampling a great variety of carburettors, ranging from the semi-obsolete two-lever "sensitive" type through the semi-automatic to the latest single-lever notions. Let me explain that I am no scientific investigator; I do not deal in e.m.f. or i.h.p., or even, like one of our contributors, make glass induction pipes and count the flying globules of spirit. But if a maker sends me one of his newest vaporisers, I put it on some handy 'bus, and worry its adjustments in the hope of getting more power or speed or flexibility. Well, during these haphazard experiments it has been slowly borne in on me that the genuinely automatic carburetter mops up a great deal of petrol, and that the two-lever sensitive is an easy first in respect of fuel economy, with the semi-automatic coming betwixt and between. I venture to hope this rough suspicion is accurate, because one knows that you can get a greater mileage from almost any motor car carburetter by fitting a hand-operated air inlet, provided you take the trouble to use its lever intelligently; and the two-lever sensitive is a similar combination, the main difference being that you simply have to operate its air lever, or the engine will not pull.

### **It Won't "Blind."**

I often receive letters from disgruntled owners whose machines behave admirably so long as they make no attempt at sustained speed, and the latest epistle of the sort describes how the writer's machine (a first-class touring make) "dries up" after a two or three mile scrap, and concludes naïvely, "Please help me, for I do love blinding!" My experience is that such cases fall into two categories, of which one is easy to remedy, and the other requires an expert. In the first class come such engines as are intrinsically

suiting for prolonged speeds, but may be hampered by a sparking plug which glows incandescent after a few minutes of maximum temperature; the obvious cure is an unheatable plug. In the second come engines which possess too small a clearance between some pair of working parts; it may be the crankshaft or camshaft bearings, the valve stems and their guides, or what not, but in my experience it is more often than not the piston and the cylinder. It takes a good man to discover where the friction develops as the engine heats up, and a better man to cure it, for it is not given to the average amateur mechanic to turn a thousandth of an inch or so off a bush or a shaft without spoiling the part. I was much derided in this paper on one occasion for rashly confessing that I always look for high spots on my piston skirt when I first decarbonise a new engine, and that if I find them I rub them down with a file and a ribbon of sandpaper. But after all, the piston skirt's main function is to act as a carrier for the piston rings, and while a high spot on its skirt may cause a lot of friction, a trivial excess of skirt clearance cannot hurt the engine much.

### **Speed and Plugs.**

Talking of speed reminds me of the year 1909 which I spent trying to prevent a particularly racy  $3\frac{1}{2}$  h.p. single from getting tired. It could do 60 m.p.h. whenever conditions permitted, but it could not keep going, and after a comparatively mild speed burst was sure to stop dead on the next rise, whilst a prolonged scrap would fetch it all up standing on the level. Pre-ignition was naturally the immediate cause, and the primary cause was excessive compression ratio. Of course, I was a bit of a juggins in those days, and never suspected my sparking plug, though I know now that the only month in which it revealed stamina was the month in which I chanced to fit an unheatable plug. I used to decarbonise that engine every Friday night; the works manager at the factory swapped my cylinder twice, in case there should be a rough edge inside the casting somewhere, and he turned me up some special valves minus the usual grinding slots in the heads, lest their edges should be getting incandescent. We live and learn. I have two engines in my shed at this minute, either of which would behave in exactly the same way if they were scrapped on certain plugs in my store. But if I put in a Lodge racing plug, or the Sphinx equivalent, either of those engines would do ten laps of Brooklands all out without a murmur. Stupids we were in 1909; we hadn't the sense to see that the sparking plug electrodes were the most likely cause of pre-ignition, as constituting the longest and thinnest projection into the combustion chamber. On the other hand, sparking plug makers were then equally dense, and though there were even then a few odd plugs which could stand a good deal of heat, their makers were in blissful ignorance of their merits, and did not know how the merits were achieved.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Removing Tar Spots.

? Will you kindly inform me the best means of removing tar from a coachbuilt sidecar?—E.L.M.

The best plan is to remove the tar before it dries by means of grease or butter. If you leave it for a day or two it is practically impossible to get it off without damaging the paintwork.

### What is a Centre Line?

? Will you please describe the meaning of the centre line when referring to the engine pulley and the back wheel belt pulley or rim? I notice in catalogues the back belt rim is described as being 1½ in. or 2 in. or 2½ in. centre.—E.L.S.

The centre line is that which lies along the centre of the engine pulley and the belt pulley. Talking of the back belt rim as being 1½ in. or 2 in. centre means that from the centre line of the back belt rim to the centre line of the back wheel is 1½ in. or 2 in.

### Photographing while on Tour.

? Would you kindly let me know how the Defence of the Realm Act affects carrying a camera when on tour? If it is necessary to have a permit, does the permit only last for a certain period of time, as I have heard it said that you have to state where you are going, and the permit is only made out for that district. Is it possible to get a permit to carry a camera anywhere, as I often go for runs during week-ends, and would like to have my camera with me? Where do you apply for a permit?—R.W.

Fortunately, as regards photographing, things are not so bad as you would imagine. You may carry a camera anywhere, provided you carry it ostensibly, so that if you are stopped by a patrol and told that a camera must not be taken into any prohibited area you can deposit it, if you cannot get a permit to use it in the said area. In most parts of the country, except in places where special regulations obtain, such as near fortifications or near the coast, people are allowed to use a camera without let or hindrance. When permission is necessary it should be obtained from the local military authority.

### Testing Oil.

? I should be very glad if you would kindly let me know how I can test two or three different grades of lubricating oil to find out their respective properties, flashpoint, residue, etc.—E.H.

To test the flashpoint of oil, place the oil in a receptacle with a Bunsen burner or spirit lamp underneath it and a thermometer suspended in the centre, with its bulb just touching the surface of the oil. Carefully watch the temperature, apply a match at intervals, and at the moment of ignition note the temperature on the thermometer. The residue can be obtained by slowly boiling away the oil. These experiments can really only be satisfactorily carried out by a qualified chemist.

## NEXT WEEK!

PROOF OF THE

## Economy and Utility

OF

## MOTOR CYCLES & SIDECARS.

### Speed Wobble.

? Will you explain and give reasons of a speed wobble? I am given to understand that on attaining a fast speed (about 40 m.p.h.) one is apt to develop this so-called speed wobble, which cannot be accounted for. Is there such an occurrence as a speed wobble on a good road, and what precautions are necessary? Do you think it is caused by nervousness?—RIDER.

This wobble, which is experienced when travelling at speed, is extremely difficult to account for. The most likely causes are the following: Incorrect rake of front forks, whipping of frame owing either to wear or incorrect construction, or wheels slightly out of truth. Also, as you mention, a certain amount of nervousness on the part of the rider might account for it. The wobble should never occur at speeds of less than

60 m.p.h., or thereabouts. Nothing of the sort should be experienced at ordinarily fast road speeds. The remedy is to slow down a little.

### How Much Oil?

? I possess a 1914 2½ h.p. three-speed single-cylinder Premier, and I have been in the habit of giving my engine a pumpful of oil every seven miles. Do you think this rather too much, as I have to decarbonise every 700 or 800 miles?—H.C.J.

It all depends upon the speed at which you are travelling. If you are only going at 20 m.p.h. you should give half a pumpful every seven or eight miles; if driving faster you naturally give more oil.

### Clutch Slip.

? My machine is a 1914 3½ h.p. three-speed. The multiple-disc clutch slips slightly on the level at wide throttle openings and if I suddenly accelerate; on very bad hills it slips quite a lot, especially on the lower gears. The control rod is not holding it out at all, and, so far from over-oiling, I have not oiled it at all for some time, but have simply flushed it out with paraffin. There are ten springs, mostly quite stiff, but rather uneven in lengths and tension; they were like this when I purchased them a little time ago, but the makers said they could not get them more exact than this. When I put them in, I placed the strongest opposite each other, but found (as on previous occasions) that one particular place required three or four very strong springs to make the plates grip evenly; I can find no possible reason for this, but possibly this may give you a clue as to why the clutch slips. Please tell me the reason and the remedy. I may add that the springs are tensioned as tightly as possible.—F.D.S.

What you ought to do is to flood out the clutch again with paraffin and inject thin oil. If you have not enough oil the plates will wear and the clutch will slip. From what you say the springs appear to be strong enough. If, after the treatment we have recommended, you find that the clutch still slips, then possibly an extra plate would cure the trouble.

## PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the import of paper material by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

**Loss of Compression.**

**Q.** I have a 3½ h.p. three-speed 1916 motor cycle. The compression is very weak. I have examined the piston rings, valves, and seatings. All joints appear to be gas-tight.—PUZZLED.

It is just possible that one of the valves is not seating properly, and you lose compression in this manner. See that the tappets are adjusted so as to leave sufficient clearance.

**Fitting a Magneto Switch.**

**Q.** I ride a 1915 model 2½ h.p. two-stroke motor cycle, and, as you know, two-strokes will "four stroke," or otherwise run irregularly, down hill. I have been thinking that if I were to fit a switch on the handle-bar I could then cut out the magneto, thereby coasting with the throttle a shade open and the air open fuller, thus cooling and scavenging the engine. The magneto is one made by the Elkhart Mag. Co., U.S.A. Will it do the magneto any harm if I connect this terminal to the switch on the handle bar? Also, ought I to use high or low-tension wire? My reason in applying to you is that some people tell me a magneto cut-out does the magneto harm. If this is so, why do the makers fit a terminal opposite to the high-tension terminal?—P.A.S.

It cannot possibly do the magneto any harm to have a switch on the handle-bar. You have to use a low-tension wire, and order from the magneto makers a contact breaker cover to which a switch terminal is fitted, if there is not one already. We should very much like to hear why the extraordinary idea prevails that a magneto switch does a magneto any harm. It would be interesting to know what is the explanation of those who assert this to be the case.

**Unequal Power in a Twin.**

**Q.** Could you possibly tell me why on my 6 h.p. Bradbury the back cylinder will drive the engine alone when the front one has its plug out, but the front cylinder will not act in the same way when the plug is off the back cylinder? Of course, there is no necessity to run one's engine in this way, but I am wondering if the front cylinder is developing equal power to the back one; or is this a usual symptom in twins? Reversing the plugs makes no difference, and with a motor friend I have inspected the magneto and plugs, and found all in order, and the sparks quite even. The carburettor is a B. and B.—S 5780.

Obviously, the front cylinder is developing less power than the back. In the case of a two-cylinder engine it is very rare that the two cylinders give off equal power when tested in this way. Possibly the valves in the defective cylinder require adjusting, the rings may be stuck up, or some small defect of this kind prevents the front cylinder from developing the full power. It is hardly likely that the plugs or magneto are at fault. The trouble is more likely to be such things as difference in the strength of the valve springs, tappet clearances, a badly fitting piston or rings, or uneven lubrication.

**The Storage of Petrol.**

**Q.** I should be greatly obliged if you would tell me what quantity of petrol one is allowed to keep (away from the house, but on the adjoining land in a shed) without a licence. The petrol is for private use only, not for sale.—C.H.F.

A private owner may at the present time store petrol not exceeding sixty gallons in quantity in two-gallon cans in a shed not attached to any main building, and not within twenty feet of any main building.

**Petrol and Fire.**

**Q.** I have just bought a petrol tank which comes within about 2in. of the cylinder head, and I would like to know if there is any danger, say, after running a good distance and the cylinder getting hot, of the petrol catching fire? The heat, of course, would play on the under side.—J.H.

There is no danger whatever of the petrol becoming ignited through the cylinder head being close to the top of the tank, provided, of course, there are no leaks directly on to the cylinder head.

**Removing Rust from Water Jackets.**

**Q.** I should be very much obliged if you would tell me the best way of removing rust which has formed rather thickly in the water jackets of my machine.

Is there any chemical which can be used for this purpose without damaging the metal? I presume a thick coat of rust would affect the cooling principle to some extent.—H.L.A.D.

Use dilute sulphuric acid, if the rust is very bad, and wash out thoroughly afterwards with caustic soda. Certainly a thick coat of rust will affect the cooling system of the machine.

**EXPERIENCES WANTED.**

"R.C.F." (London).—Treatment of tyres with Rubberine and its effect on speed.

"B.W.H." (France).—Flexibility in traffic of a machine fitted with a Philipson or Grado pulley.

**RECOMMENDED ROUTES.****BIRMINGHAM TO PONTYPOOL.—W.H.B.**

Birmingham, Bromsgrove, Worcester, Malvern, Ledbury, Ross, Monmouth, Usk, Pontypool.

**EXETER TO LUTON.—J.T.H.**

Exeter, Honiton, Ilminster, Ilchester, Sparkford, Bruton, Frome, Trowbridge, Devizes, Swindon, Faringdon, Oxford, Thame, Aylesbury, Tring, Dunstable, Luton. Approximately 190 miles.

**RISCA TO LIVERPOOL.—M.A.A.**

Risca, Abertillery, Brynmawr, Abergavenny, Pontrilas, Hereford, Leominster, Ludlow, Craven Arms, Church Stretton, Shrewsbury, Wem, Whitchurch, Chester, Birkenhead, by ferry to Liverpool.

**BURTON-ON-TRENT TO AYLESBURY.—B.C.**

Burton-on-Trent, Ashby-de-la-Zouch, Atherstone, Smockington, along Watling Street to Daventry, then through Towcester, Buckingham, Hitchchurch, Aylesbury. Approximately 88 miles.

**WEYMOUTH TO BRADFORD.—F.J.M.**

Weymouth, Dorchester, Blandford, Salisbury, Andover, Newbury, East Isley, Abingdon, Oxford, Kidlington, Ardley, Baynard's Green, Brackley, Towcester, Northampton, Kettering, Duddington, Stamford, Grantham, Newark, Tuxford, Retford, Doncaster, Wakefield, Batley, Bradford.

Miss Elsie Hunting, a sister of a ward at the Seamen's Hospital, Greenwich, is a recruit to the ranks of lady motor cyclists. She is shown above, starting for a run on her 4½ h.p. B.S.A. sidecar.

# May we send you this book ?

32 pp.  
fully  
illustrated.

**I**T is full of useful facts about motor cycle and cycle tyres—how to get the most and the best out of them, whether Avons or any other make. It will help you to play your part in the National Thrift Campaign. It is free and post free.

SYNOPSIS:—The Avon Factories—Types of Avon Tyres and Machines for which they are designed—Condensed Hints on Tyre Usage—Correct Treatment for Tubes—Scientific Belt Drive—Avon Honours—The Importance of Inflation—Economical Mileages, etc., etc.

Please ask for the Tyre Book, Section 2 (Section 1 deals with Motor Tyres), and address:—

WORKS:—Melksham and Bradford-on-Avon. SERVICE DEPOTS:—Manchester, Glasgow, Birmingham, Bristol, Newcastle, Nottingham, Aberdeen, Swansea, Paris. OVER 1,000 AGENTS STOCK AVONS.

*In answering this advertisement it is desirable to mention "The Motor Cycle."*

## NEWS FROM GERMAN EAST AFRICA

German East Africa is certainly an interesting place from which to get reports on Dunlop motor-cycle belts! And when I hear that *every* belt-driven machine used by the Dispatch Riders under General Smuts' command is fitted with a Dunlop round-top belt, I draw my own conclusions, i.e., that the rigours of active service conditions have served to demonstrate the inherent superiority of yet another Dunlop product.

# A NEW CLYNO FRAME.

An Interesting Frame Construction.

Elevation and plan views of the recently patented Vickers-Clyno frame.

In view of the articles published in *The Motor Cycle* on the subject of frame design, it is interesting to record that there appears to exist at the present time activity in the development of the frames of sidecar outfits. The tendency is to get away from the conventional type of cycle frame to which the sidecar is attached to the bicycle in the most suitable manner that happens to offer.

In the case of outfits which are primarily intended to be employed with the sidecar permanently attached, some latitude is afforded in the design of the cycle frame and sidecar connections, and the illustrations here given show a construction which has been evolved and protected (patent No. 7,289, 1915) in the names of Messrs. Vickers, Ltd., G. T. Buckham, and Frank Smith (of Clyno fame).

It will be seen that the motor cycle frame is dupli-

cated, comprising two main triangular structures A B C, one at each side. These are braced by additional members, as can be clearly seen from the illustrations, the method of supporting the steering head being clearly shown, whilst the slots for the rear wheel spindle are indicated at D. In the plan view will be seen at E F and G the main connections for the sidecar tubes, and it will be understood that the lateral rigidity afforded by this construction of the motor cycle frame will render the connections E F G extremely stiff, so that twisting of the sidecar in relation to the cycle will be prevented.

The position of the saddle is indicated at H in the plan view, but no clue is given as to the intended disposition of the engine, tank, etc. Until further particulars of this interesting development are available it would be unwise to criticise.

## Next Week's Special Number of "The Motor Cycle."

WHAT THE SIDECARRIER HAS DONE AND CAN DO.

ing delivery of their goods; and the object of the next issue of this journal will be to show what can be done to relieve the situation by the use of a motor cycle with commercial sidecar attached. Not only will the utility of the motor cycle be illustrated, but also its economy.

Experiences of numerous small tradesmen will be a feature, together with an article setting forth the advantages of the sidecarrier for this sphere of work. This will be

accompanied by comparative working costs of light horse vans and motor sidecarriers.

Another article will deal with motor cycles in the hands of press photographers, and many instances will be given where a pressman has been able by means of his motor cycle to secure "scoops" over his less fortunate brethren who had to rely on railway trains or other less convenient means of conveyance.

Then there are the claims of the motor cycle for a doctor; the varied uses of the motor cycle, apart from actual combatant service, in military duties; and many other instances of the utility and economy of the two or three-wheeler. Thursday, June 29th, is the date of the issue.

## VOLUNTEER SIDECARISTS WANTED FOR MANCHESTER.

THE officer in charge, Mr. E. Woods, of the Motor Transport Section, 5th East Lancs. Battalion V.A.D. of the British Red Cross Society, tells us that he is anxious to fill up a few vacancies for owners of sidecars and light cars in the Manchester district who would be willing to join the battalion. The work, part of which consists in taking out wounded soldiers for runs, is entirely voluntary, and can easily be done in spare time, particularly on Saturday afternoons. Those interested should write to Mr. Woods, at 287, Deansgate, Manchester.

A CONTRAST.—A young woman can soon learn to drive a sidecarrier.

A MORE opportune moment than the present for the production of a special number of *The Motor Cycle*, setting forth the claims of the commercial sidecarrier, would be difficult to find. The commandeering of horses in the early days of the war upset the delivery arrangements of many tradesmen, to be followed more recently by the scarcity of men as a result of the Military Service Act. The consequence is that tradespeople, both those with small and large businesses, are in difficulties regard-

## "THE MOTOR CYCLE" RECRUITING SECTION.

This section was instituted with the sole object of assisting readers and directing them to the many different branches of the Army and Navy for which their special knowledge suited them. At the outbreak of war numerous letters reached us (and continue to arrive) from men at home and overseas possessed of motor engineering knowledge, explaining their difficulty in obtaining particulars of Specialised Sections (notably the Motor Sections), recruiting officers being invariably occupied by the demands of the line regiments. The Editor is Inspecting Officer for the M.M.G.S., Heavy Section, Machine Gun Corps, and R.E. Despatch Riders. Throughout, the work has been purely honorary, and Recruiting Commissions have not been accepted. To date 9,868 readers have taken advantage of our proffered assistance.

### R.E. Despatch Riders.

**A** CERTAIN number of vacancies exist in the different areas for Royal Engineer despatch riders. The test applied to candidates is much more stringent than formerly. Applicants must be at least 18 years 9 months, and have had prolonged experience with motor cycles, and capable of all running repairs. The pay in the R.E. Signal Section is 2s. 6d. per day, plus 6d. on passing the engineers' test.

An up-to-date list of secretaries for the different areas was given in our last issue, page 561, and readers residing in the different localities should apply to the local secretary.

All applications for enlistment as despatch riders in the R.E. from the London district and Overseas should be made to the O.C. Signal Service Training Centre, Woburn, Beds., not Dunstable, as stated last week.

A number of riders have been examined by the Editor of *The Motor Cycle* in technical and riding ability during the past week, and passed for the waiting list of the South Midland Divisional area.

### Admiralty Yacht Patrol.

Men possessing workshop experience and a thorough knowledge of petrol engines and the use of tools in connection with their running and repair may obtain positions in the Royal Navy by applying to the Yacht Patrol, Admiralty, London, S.W. Chief motor boatmen, who must be qualified mechanics with at least five years' workshop experience, age

Motor cyclists attached to an ammunition sub-park in France. Reading from left to right the names are: Read, Hudson, Hepworth, Scott, and Hands, the last-named being a former competition rider. All the machines are Douglasses, and particular interest is attached to this picture in that the two sidecars are the new 4 h.p. models. This is probably the first photographic evidence published of the 4 h.p. Douglas on active service.

22-45, are paid 5s. 6d. per day, with 3s. per day allowances. Motor boatmen, with a knowledge of petrol engines and the use of tools in connection with their repair, and possessed of two years' workshop training, age 18-45, receive 2s. 6d. per day with 3s. per day allowances. In addition to this pay a gratuity is made in lieu of uniform, whilst separation allowances are on the same scale as the R.N. Applications by letter should be accompanied by references showing period of workshop experience, medical certificate, and discharges.

### M.M.G.S. and H.S. Machine Gun Corps.

The Motor Machine Gun Service and the Heavy Section, Machine Gun Corps, are still closed. In reply to enquiries, which continue to reach us, we may state that when vacancies occur in these particular sections, an announcement to that effect will appear in these columns.

### The Technical Corps.

The Technical Corps, including the Royal Flying Corps, is now open for practically every trade. The R.F.C. wants a number of motor transport drivers, storemen used to the upkeep of engineers' stores, also sailmen.

### The Motor Transport.

In connection with the Army Service Corps, we are officially advised that motor cyclists are not at present required in the Mechanical Transport branch, but car and lorry drivers are wanted; pay 1s. 2d., rising to 2s. 4d. when proficient. Mechanical Transport examining officers are now scattered about the country on special recruiting work, and application should be made to them through local recruiting offices.

### R.E. Wireless Section.

Mechanics with a good practical knowledge of petrol engines, and able to perform repairs to such engines in the field, are required by the Wireless Section of the Royal Engineers. The applicants will be required to enlist as sappers in the Wireless Section of the Royal Engineers, but we are informed by the O.C. of the Training Centre that the prospects of promotion for satisfactory men are very good. Enlistment is for duration of the war, and applications, mentioning qualifications, should be addressed to the O.C., Wireless Training Centre, Worcester.

STAFF OF THE MOTOR MACHINE GUN SERVICE TRAINING CENTRE.  
Reg. Sgt.-Maj. Dowland. Maj. J. S. Archer. Lt.-Col. R. J. Colson. Maj. E. J. W. Spread, C.O. Adjutant.

# THE LONGUEMARE-HARDY CARBURETTER.

An Automatic Carburetter for Use on Motor Cycles.

**N**OW that automatic carburetters are becoming more and more general for motor cycle use, it is likely that the model which we describe and illustrate will be adopted on many machines. The principle has already been proved to be most successful in the larger sizes for car work.

In the old days, the great majority of motor cycles were fitted with Longuemare carburetters, and they gave most excellent service. The rose-jets vaporised the petrol very satisfactorily, and if, owing to their smallness, the jets sometimes became obstructed, they were easy to clean. Briefly, this carburetter contains a reserve chamber to supply a rich mixture for acceleration purposes, and a pilot jet for starting and slow running.

When the float chamber is filled, petrol passes through the primary jet A, which controls the supply of fuel used in general running into the reserve chamber B, as well as into the main and pilot jets C and D. At starting the position of the throttle is as shown in the sketch on the right. The main jets are cut off, and the suction of the engine acts through the small openings E and F upon the pilot jet only, which therefore supplies a small quantity of rich mixture. A certain amount of air is allowed to pass between the top of the jet and the throttle barrel, a further supply controlled by a regulating screw being admitted through the hole G. While the pilot jet only is in use the primary jet A is able to supply more petrol than is being used by the engine, consequently the reserve in the chamber B is not used. When, however, the throttle is opened and the main jets C come into play, more petrol is required for acceleration purposes, and this is supplied from the reserve petrol in B. As the engine speed increases this petrol is used up and air enters B through the hole at the top, and, mingling with the petrol above the jet A, gives an economical mixture so long as the engine is running fairly fast. Should the engine speed be reduced, the suction on the jet becomes less, and, instead of the mixture becoming weaker when a stronger mixture is required, the air coming through B is cut off by the petrol rising in the reserve chamber, since the engine is not taking all the fuel supplied by the primary jet A. Thus the reserve fills up ready for the next acceleration.

It is in this matter of acceleration that many automatic carburetters fail, for, unless the mixture is set on the rich side and the carburetter consequently extravagant in fuel, it is apt to be too weak to give that rapid pick-up which at times is so desirable.

## Fitting and Adjustment.

Every carburetter is sent out with an assortment of jets and choke tubes. When those in place have been tested the others can be experimented with if necessary. If the engine pulls well at half throttle but weakly at full throttle, fit a larger primary jet, for

more petrol is required. If the reverse, a smaller primary jet. Poor acceleration means that the choke tube is too large (this is held in place by a screw and can be quickly changed), while good acceleration but weak running means that it is too small.

Further, the throttle opening for slow running can be regulated by means of the screw H, and the pilot jet mixture by the screw K. It is the work of a moment only to remove the throttle complete with the returning spring; this gives access to

the choke tube. For convenience the petrol pipe union is rotatable about the base of the petrol chamber.

It is interesting to note that Messrs. Humber are fitting the Longuemare carburetter to the horizontally-opposed twin-cylinder sidecar outfits which they are supplying to the Russian Government (see page 569 of our last issue). This is a good testimonial in itself, for it is certain that no expense is being spared to render these machines as simple and efficient as it is possible to make them.

The English agents are Messrs. E. J. Hardy and Co., Queen Victoria Road, Coventry.

A primary jet; B, reserve chamber; C, main jets; D, pilot jet. These and the other letters are referred to in the letterpress.

**TRADESMEN** desiring rapid  
and economical Parcel Carriers will be  
particularly interested in next week's  
UTILITY NUMBER of this journal.

## TIMES TO LIGHT LAMPS.

"SUMMER" TIME.

June 22nd	...	9.49 p.m.
" 24th	...	9.49 "
" 26th	...	9.49 "
" 28th	...	9.49 "

## Leading Manufacturer Married.

On Tuesday, the 20th inst., the wedding took place of Miss Doris Pritchard and Mr. William Hughes Butterfield, one of the partners of the Levis Co., at St. James's Church, Moseley Hill, London, N.

We extend our best wishes.

## American Competitions in Full Swing.

Glancing through latest copies of our American contemporaries makes one long for the end of the war and the return of competitions. At present on the other side of the Atlantic hill-climbs and club runs are in full swing, and a great part of the papers is devoted to descriptions of the events.

## Racing in the Argentine.

A 220 miles road race was held recently by the National Motor Cycle Club of Buenos Ayres. Results were as follow:

A. Bernasconi (Harley-Davidson).

C. Santiago (Indian).

J. Hourdebaight (Indian).

Winner's time, 5h. 33m. 30s.

This is the second year in succession Bernasconi has won the event.

## The Thornton Heath Wounded Soldiers' Outing.

The wounded soldiers' outing (referred to on page 564 of last week's issue), which a patriotic inhabitant of Thornton Heath, Mr. Alfred Taylor, is proposing to organise, will consist of an excursion from the clock, close to Thornton Heath Station, starting at 2 p.m. on Wednesday, July 5th, to Leith Hill Hotel, where tea will be provided, the cost of which will be 1s. The route followed will be Sutton, Epsom, Leatherhead, Dorking, and Coldharbour, the distance being about twenty-five miles. Tea, which will be supplied by the driver to his guest, will be served at 4.30 p.m., and the return journey will be made via Westcot, Dorking, and Reigate, the starting point being reached about 7.15 p.m. Mr. Taylor has already been promised assistance from eight or nine local drivers of sidecar combinations. Offers addressed to Mr. Taylor, c/o *The Motor Cycle*, 20, Tudor Street, E.C., will be forwarded to the right quarter.

## Many Accidents.

A number of accidents involving motor cyclists have occurred of late on the English roads. Many riders are soldiers, and there have been one or two fatal results. About twelve months ago, for a period of a few weeks, there was a regrettable run of accidents, and we hope this is not going to be repeated. The only thing to do is for every road user to exercise double care, as one is forced to the conclusion that there are many novices on the roads.

## Motor Cyclists in Line Regiments.

Though motor cyclist despatch riders are attached to the different Yeomanry regiments, it is seldom, if ever, that they are allowed to proceed abroad with their units. According to letters which have reached us, on several occasions motor cyclists who have served their training as despatch riders have finally been put into line regiments with a rifle, on account of their units having been ordered to proceed abroad without motor cyclists.

## Legless and only One Arm but still a Keen Rider.

A Los Angeles cripple—A. Leroy—is touring the American Continent on a Harley-Davidson sidecar. Leroy has both his legs off at the hips and his left arm at the elbow, but he is able to sit in the sidecar and operate the specially adapted controls. There is no saddle on the machine at all, which is started by a hand lever at the side. The handlebars are displaced by a rod fastened to the head of the steering column and at its other end to the stump of Leroy's arm, with which he steers.

A Dutch military despatch rider, F. Schuwer, and his Douglas.

## SPECIAL FEATURES.

USEFUL HINTS TO TWO-STROKE USERS.

A MOBILE SECTION IN TRAINING.

## Who Said Economise?

What absurd logic it is to hinder motor cycling, when travelling by motor cycles is still cheaper than journeying by train! Those who are not acquainted with the economy of motor cycles should see the special articles in our *Economy* and *Utility* Number to be published on the 29th inst.

## A Belated Decision.

At a committee meeting of the Woolwich, Plumstead, and District M.C.C., not only was it decided to postpone all competitions, etc., *sine die*, but no further committee meetings will be called until the war is over.

## Learning to Drive on a Main Road.

On Saturday last a woman was seen teaching another to drive a small car on a main road along which there was an almost continual stream of motor cycle, car, and pedal cycle traffic. The new driver was evidently ill at ease, and she narrowly avoided running into two pedal cyclists. Surely novices should be made to learn to handle cars or cycles, as the case may be, on by-roads before trying on a main road with heavy traffic.

## Shortage of Petrol and a More Serious Shortage of Cards.

No wonder the post offices in different districts ran out of petrol cards! Any Tom, Dick, or Harry could go and get one, or a complete set of them for that matter, by applying to a Money Order office.

The announcement that cards were available having been left to the daily press (the motor journals were ignored), no doubt the curiosity of many was aroused, and whether they owned a motor vehicle or not applied for a petrol card. Otherwise how can the shortage be accounted for? Manilla card, too, is not cheap in these days, and, as a sister journal pertinently asks in the current issue, what does the War Savings Committee think of this waste? Apparently there was no check of any kind on the distribution of the cards. A bad beginning indeed!

**The Specialised Sections.**

The Recruiting page this week contains announcements of a number of vacancies which exist for practical motorists.

**A Prohibited Poster.**

A four-sheet poster displaying Beldam tyres, now to be seen on different hoardings all over the country, has been rejected by the Censorship Committee. The decision has greatly surprised the Beldam Tyre Co.

**The Light Car in Combatant Service.**

Light cars are being tried by the Motor Machine Gun Service for rapidly transporting machine guns. Some exclusive photographs of the equipment appear in *The Light Car* published yesterday (Wednesday).

**The National War Funds.**

At the week-end the principal war relief funds stood as follow:

The Prince of Wales's National Relief Fund	(£3,318,000 distributed)			
		£5,907,213	0	0.
Fund for the Sick and Wounded		3,900,000	0	0
Tobacco Fund		108,632	6	11
The Queen's Work for Women Fund		169,574	14	4

**British Motor Cycles for Italy.**

The Italian Government has now decided to try the Douglas motor cycle, and has ordered a hundred machines of the three-speed clutch type. Hitherto the Italian Government has not looked favourably upon the lighter types of motor cycles, so that the decision is of more than ordinary interest.

The Prince of Udine of the Italian Royal family has also ordered a 4 b.p. Douglas.

**Motor Cyclist Airman.**

Capt. Jack Woodhouse, R.F.C., is proving a more daring aviator—if that is possible—than motor cyclist. His magnificent riding in the Isle of Man and other places in peace times has now been eclipsed by some daring performances in the air. A few days ago, at a police sports meeting in the Midlands, Capt. Woodhouse appeared overhead, and proceeded for about a quarter of an hour to send thrill after thrill through the crowds of spectators. He looped the loop many times, performed spiral dives, and finally circled the grand stands practically at right angles to the ground!

**Records after the War.**

Shall we see records go by the board immediately the war is over? It would appear that there will be much slashing of times, if we are to judge by letters we are constantly receiving, particularly from men in the Services. One writer, whose name is by no means unknown in the competition world, offers to guarantee that he will bring down the hour sidecar figures "without the least fuss" on his Harley-Davidson machine. Another writer, J. Cooper, of Gosport, writing concerning the same make of machine, claims to have attained the speed of 74 m.p.h. with another man on the carrier. He states that he is perfectly willing to take anyone who cares on the pillion seat, so that he may prove the truth of his remarks by his Cowey speedometer. No doubt hundreds of readers will jump at the opportunity!

**Reserve Petrol.**

We observe that many motor cyclists are making a practice of carrying a spare tin of petrol on their machines, as we have advised. This seems to be the surest method of getting home when visiting doubtful districts, and one may travel free from worry as to a possible shortage of fuel.

**The Don't Posters.**

The War Savings Committee's posters have been seen of late in the Midlands. They are not at present on the gigantic scale that they are in London, and few provincial motor cyclists will have yet seen the appeals for the giving up of pleasure motoring. But surely the time and money spent on fixing up so many huge posters in town could have been much more profitably used.

**More Petrol Waste.**

Colonel R. W. Barclay has reluctantly been compelled to close the Nower, one of the beauty spots of the Dorking district, the reason being the bad behaviour of the crowds of London people brought down, especially on Sundays, by motor buses. The park has been littered with broken glass and other rubbish. The petrol used in this manner certainly might be better employed.

**For the Novice.**

After a short interval we have renewed our "Hints for Beginners," an article published to-day describing in simple language the method of overhauling a two-stroke engine. This, in conjunction with the large sectional views showing the cycle of operations in a two-stroke published last week, should enable the absolute novice with a two-stroke to become quite at home with his mount.

**Still More Lady Riders.**

It is gratifying to notice the increasing number of girls and women riding motor cycles. Sidecar outfits in particular appear to be very popular with the feminine sex, and it is quite common to see a lady taking a friend for a run. When the seasoned riders of the pre-war days come home after the war one of the surprises they will experience will be in the number of lady motor cyclists on the road.

**T.T. Rider as Instructor.**

Leon Cushman, formerly of the Coventry Premier, Ltd., and now with the R.N.A.S., is at present acting as instructing officer on aero engines at an English aerodrome. He writes that he would prefer a few laps of the Isle of Man course, and doubtless so would many other well-known riders who are now in the Services.

**An American Four Hundred Miles Trial.**

There were forty-five starters in a 400 miles—two days—reliability trial held at the end of last month by the New Jersey M.C. By far the greatest proportion of riders were mounted on Indian and Harley-Davidsons; in fact, the only other mounts represented were Reading-Standard and Cleveland. The latter is a two-stroke lightweight that has been illustrated in *The Motor Cycle*, and it met the Indian lightweight in open competition in the special class provided for the little 'uns. A Cleveland rider won in his class. There appear to have been a great number of prizes, but the chief award went to the Harley-Davidson. This prize was the Dealers' Trophy for the team of three professional riders having the highest aggregate score.

FRENCH COLONIAL TROOPS FROM COCHIN CHINA—AND THE INEVITABLE DOUGLAS.

The Annamites from Cochin China have arrived at Salonika, where this photograph was taken. Their head dress, which might almost be mistaken for a steel helmet, is worthy of note.

# HIGH SPEEDS IN AUSTRALIA.

A 200 Miles Road Race won on a British 3½ h.p. Single-cylinder Machine at an Average of 50 m.p.h.

AN important road race was run in Victoria, Australia, on Easter Monday last, and the results aroused world-wide interest by reason of the big entry list and the very high speeds accomplished. It may be as well to state at the outset that the patriotic carnival, of which this 200 miles race was the chief feature, was held in aid of the local war funds.

The organisers were the Victorian M.C.C., and the course (which was 33.9 miles to the circuit) at Mortlake, 150 miles from Melbourne, was the same on which Erwin G. Baker made most of his records during his visit to Australia at the beginning of the year, including the twenty-four hours record of 1,028 miles 30 yards. The surface is very good, especially for a colonial road—the high speeds accomplished are some indication of that fact.

## England v. the U.S.A. in Australia.

There were sixty-one entries, and of these twenty-seven were riders of American machines. There was a good proportion of locally assembled machines fitted with European engines. The race being a handicap event, the first batch of three limit men was sent off exactly an hour in advance of the two scratch men—R. Finlay (7 h.p. Excelsior) and J. Booth (7 h.p. Indian). These two are leading Victorian riders, and the entry list contained the names of all the local

experts and several from the neighbouring States.

A keenly contested race, full of incident as motor races usually are, resulted in a win for A. Watts (3½ h.p. Rudge Multi), who rode a remarkably fine race. His luck was in, too, for his machine ran consistently throughout. This British success against such a strong American element is noteworthy, especially in view of the efforts for British overseas trade that the Americans are now making. At the same time the following results indicate that the American machines showed up prominently:

	H'p.	Actual time.	Average speed m.p.h.
1. A. Watts (3½ Rudge)	.. 50m.	4h. 4m. 27s.	49.9
2. N. H. Duckett (7 Indian)	.. 9m.	3h. 40m. 42s.	55.2
3. R. Dawson (7 Indian)	.. 9m.	3h. 49m. 37s.	53.1

## Records Lowered.

The high speeds will be noted, many new records being claimed. Watts's time for the first 101.7 miles was 2h. 2m. 54s., equivalent to approximately 100 miles in two hours, which is claimed as an Australian record for a machine under 600 c.c. Duckett accomplished the fastest time, averaging over 55 m.p.h.

In the unlimited class, H. A. Parsons (7 h.p. Harley-Davidson), by covering the first 101.7 miles in 97m. 20s., broke the road record for that distance. The record formerly stood at 108m., this time

being made by K. Walker on an Indian in 1914. Erwin Baker, when putting up his twenty-four hours record on the Mortlake course a few months ago, covered the first hundred miles in 110 minutes. Parsons put up a splendid fight, and chased Watts home, until, in the last lap but one, a broken inlet dome put him out of the running.

In connection with this world's record for 100 miles, it is as well to bear in mind that there are no officially recognised speed records on the road in England, for obvious reasons. Further, comparisons with times made in the Isle of Man races are not possible, by reason of the totally different nature of the courses.

Watts, the winner, stopped twice for petrol only. His Rudge was fitted with a Pedley belt.

## A RELIABILITY TRIAL.

In the 150 miles run to Mortlake from Melbourne, for the 200 miles race described above, the Victorian M.C.C. took advantage of organising a reliability trial, the start being from the Victorian capital at 9 a.m. on Good Friday morning. The results of this trial are appended:

SOLOS UNDER 600 c.c.  
T. B. Murphy (2½ Douglas) } Tie.  
T. Purves (2½ Douglas)  
SIDECARS UNDER 1,000 c.c.  
A. J. Sutherland (3½ P. and M. sc.)

# FILLING UP THE PETROL CENSUS FORMS.

## Some Points which have Puzzled Riders.

SINCE our last issue was published the Petrol Census has come and gone. The announcements were made in the daily papers only, and the technical press, which is read by the majority of, if not by all, motorists was ignored. This was a pity, as many of our readers required advice and enlightenment on the subject of the forms. There are always many little difficulties, which crop up in the filling of official papers, very puzzling to the average man, and it seems to us that these Government papers are frequently drawn up without any help from experienced men. For instance, how was the man who has not ridden during the present year, but has a mount on order, to fill up his form? He has no registration number, no average for the three months ended April 30th, and his estimated requirements must be the merest guesswork. Another point! It is stated that any person knowingly making a false entry will be guilty of an offence involving a heavy penalty under the Defence of the Realm Act.

The R.A.C. has issued a notice stating that it is most important, in the interests of motorists, that the requirements should not be overstated. This, however, reached us only the day before the census closed, and

we were in consequence unable to make it serve any useful purpose.

The supply of forms was in some places used up on the day of issue—personally we had to apply three times before obtaining one—but whether this was due to the authorities having failed to estimate correctly the number of

motorists, or to the forms being given away indiscriminately to all who cared to ask for them, we are unable to state.

We learn, as we go to press, that forms from those who were unable to obtain them at first will be accepted for the next few days. The reason for the delay should be stated.

Particulars required to be supplied on or before the 20th day of June, 1916, by any person using or keeping motor spirit for the purpose of supplying motive power to motor cars (other than hackney carriages) and/or motor cycles in respect of which full licence duty is payable.					
Name _____		County _____

#### Naphtha as a Fuel.

Sir,—Naphtha is no doubt an excellent fuel in many respects, but a certain amount of acid is produced by its combustion, and the action of this acid on the lubricating oil and eventually on the cylinder walls is likely to cause a great deal of trouble.

I have spent a great deal of time experimenting with various fuels, and am very much afraid that neither naphtha, nor mixtures of paraffin and petrol, nor the addition of higher hydrocarbons to petrol, brings us much nearer to the solution of the fuel problem. I believe it is quite possible to "doctor" paraffin to give quite excellent results, but I understand that the same benefactors who control the supply of petrol also control the supply of paraffin. I have been running on a mixture containing 75% of paraffin for some time, but if everyone did the same I am afraid the price of paraffin would go up.

H. W. KILBY.

#### The Distribution of Weight in Sidecars.

Sir,—I thoroughly appreciated "H.M.B.'s" article on "The Risks of Imperfect Alignment" in your paper of May 25th. The alignment of the usual "Bank Holiday outfit" is enough to make a sane motor cyclist sick, but the actual distribution of the weight of the sidecar body itself as delivered by the manufacturer is enough to make him still more sick.

Look at any modern sidecar—the luxurious heavyweight usually attached to an unfortunate "3½" is the worst offender—and you will see that, when the passenger is comfortably seated, the centre of weight of the sidecar body comes about a foot in front of the sidecar axle, causing a large proportion of the weight to be supported by the unfortunate, and usually bent, front sidecar stay. This stay, in turn, hangs heavily on the head lug of the machine, which, especially in a "bent top tube" frame, has a good many strains to resist already.

Another point: What is the usual trouble with sidecar machines when hill-climbing? Answer: Back wheel slip. And to counteract this the passenger usually puts as much of his weight as he can on the carrier of the motor cycle.

Sidecar body built at home by Messrs. Addenbrooke and Corke.

Now, if the sidecar had its centre of weight directly over the back axle, all the weight of the passenger would be on the two back wheels, and if he leaned over it would put all his weight on the driving wheel.

I have seen enough sidecar chassis bent down in front to convince me that there must be great strains due to this incorrect distribution of weight.

Last vacation a friend (Mr. J. F. Corke) and myself built a sidecar body of sheet metal, and attached it to the chassis

in such a way that when the passenger is seated and some tools (an ordinary outfit) placed in the tool locker behind the seat (and accessible without disturbing the passenger) it is perfectly balanced about the point where it is fitted to the main C springs, and this point comes perpendicularly above the axle.

Back wheel slip is unknown, and there is no strain on the head lug. I enclose a sketch of the sidecar.

H. ST. V. ADDENBROOKE.

#### Touch Wood!

Sir,—Referring to "Military Cyclist's" account of his near squeak with a tramcar coming down Cemetery Hill, Chatham, can he tell us how much "lean" it took to bring the sidecar wheel twelve inches off the road level on to the kerb, what it felt like steering his outfit while running in such a position, and how much of the tramcar they cut away so that the requisite amount of "lean" could be indulged in?

We should like to know the above for future reference, because under similar circumstances we should have "leaned" away from the car, bringing the 5-6 h.p. Indian off the road, run along on the sidecar wheel, when safely past returning to our normal position, and right away without a scratch.

We submit our method as an alternative to our friend's, and leave it to any of your readers who may find themselves in similar circumstances to choose which to take.

OLD KNOCKALONG.

#### The Highest Point in Sussex.

Sir,—May I be permitted to add yet another word of correction on the subject of the "Highest Point in Sussex," first raised in your contributor's very readable article "Peace—and War" in your issue of May 25th, and the reply thereto of "Son of Sussex" in the issue of June 8th?

In this latter your correspondent suggests Ditchling Beacon as holding the "topmost place," and gives as his authority Black's "Sussex." I am afraid he has not dipped into the subject quite deeply enough, for if he will turn up the same authority again he will find Blackdown Hill 918ft. quoted as the actual "highest point." Next to this comes Duncton Beacon 837ft.; then follow Linch Ball 818ft., Chanctonbury Ring 814ft., Ditchling Beacon 813ft., Elstead Beacon 795ft., and then Crowborough Beacon 792ft.—a bad seventh on the list.

I have consulted several guides, etc., on the subject, and unquestionably Blackdown Hill is the highest point of our charming county of Sussex.

J. S. ARNOLD.

#### The Running of Two-strokes.

Sir,—I have watched with great interest the recent correspondence in the columns of *The Motor Cycle* on the overheating of two-strokes. The phrase "overheating of two-strokes" implies subtly that these machines are very prone to overheating, and, moreover, do it because they are two-strokes! I venture to assert that a carefully designed and efficiently oiled engine of this type will overheat no more than a four-stroke engine; and also that the majority, if not all, of the drawbacks raised against two-strokes are nebulous bogeys—or at least need be nothing more!

Take the overheating about which discussion has been going on in your columns. "Ixion" wrote that his baby two-stroke nearly welded its piston to its cylinder in climb-

ing a certain test hill. Assuming that the lubrication is not to blame, the responsibility for this must be due to engine design if the machine was properly driven (as no doubt it was). Otherwise *all* two-strokes would do the same!

My machine is a  $2\frac{1}{2}$  h.p. Velocette, and neither with this nor with one of the same make which I previously owned have I ever experienced overheating, although much of my riding has been done over hilly country.

This I attribute largely to the ingenious system of lubrication which the designer has incorporated with the Veloce engine, by which oil supply is automatically regulated by engine speed, less at low speeds and proportionately more at higher speeds. The oiling is taken out of the rider's hands and entirely works itself, as long as the sump contains oil. But this result is also, I believe, largely due to the cunning of the designer. Two-strokes need not overheat!

Another bogey is the common belief that such engines are extravagant with petrol. But the fact that a carefully measured gallon has just taken me 155 miles, by speedometer, over give and take roads on this machine (my weight being about 11 stone) shows that an efficient two-stroke engine can be extremely economical. I believe that I can get a better mileage even than this after a careful tuning up, and I intend to try it.

Four-stroking at low speeds (another needless phantom!) does not necessarily occur in two-strokes. I can drive at any speed from 4 to 37 m.p.h. two-stroking sweetly.

May I add that, in my belief, all these ills from which many motor cyclists sincerely believe all two-strokes suffer are matters arising from design of engine, and I believe that with a suitable design they are non-existent.

I must conclude by saying that I am entirely unconnected with the motor cycling industry, and have no interest whatever in the subject except from the position of a practical two-stroke rider.

R.L.H.C.

### Paraffin as a Fuel.

Sir,—With petrol soaring to its present price, the use of paraffin for motor cycles becomes an absolute necessity. Already the modern machine has proved itself capable of running fairly satisfactorily with paraffin, although carburetters are at present designed for spirit only. The great fault of the modern carburetter is that it does not vaporise the fuel sufficiently, and I append a rough sketch showing an additional vaporiser that could be easily fitted to an ordinary jet carburetter, the idea being that the present carburetter should proportion its fuel and air correctly, while the extra vaporiser would guard against liquid paraffin being drawn into the cylinder. The deterioration of the lubricant is noticeable when starting a machine with a big jet on petrol, and, of course, with paraffin it is additionally so, as less fuel is vaporised. The principle is clearly shown by the diagram. It consists of a circular cylinder holding a supply pipe from the carburetter. A central pipe is fitted, surrounded with a coil of pipe heated by the exhaust. This central pipe supplies the engine. Asbestos wick is hung round the space to provide extra vaporising area. Underneath there is a small tray to hold a small quantity of methylated spirit, to warm up before a start.

Contrivance to vaporise paraffin. (See letter from H. E. Rendall.)

The principle is clearly shown by the diagram. It consists of a circular cylinder holding a supply pipe from the carburetter. A central pipe is fitted, surrounded with a coil of pipe heated by the exhaust. This central pipe supplies the engine. Asbestos wick is hung round the space to provide extra vaporising area. Underneath there is a small tray to hold a small quantity of methylated spirit, to warm up before a start.

H. E. RENDALL.

Sir,—I note in last week's *Motor Cycle* a letter embodying the suggestion that vaporisation might be effected by means of a fine mesh of platinum wire gauze heated by an electric current. I hasten to write this, trusting it will be in time to prevent anyone putting this into practice, and the fire

B18

which would most certainly result. What ever other wire may be used, platinum should most certainly *not* be used, for the metal has a certain physical peculiarity known to chemists as occlusion of gases: the surface appears to absorb certain gases in considerable quantities, or in an altogether special molecular condition, which enables chemical combination to take place in a most intensive fashion.

For example: A piece of thin platinum foil and an ordinary laboratory Bunsen gas burner will demonstrate in place of carburetter and platinum gauze. The burner is a carburetter, and if the gas be turned on without lighting the burner, and the platinum foil (heated elsewhere to just a dull red, or barely red) be then held in the issuing mixture of gas and air, the metal will begin to glow, rise to a bright red, and in a very few seconds will light the burner!

Further comment is needless. This property of occlusion of gases (anyway to a marked extent) is not common amongst metals, and the proposed heated gauze experiment could be carried out with most ordinary wires, but not with platinum.

(REV.) F. C. LEES.

Sir,—Knowing you are interested in the use of cheap fuel for motor cycling, I send a description and rough sketch of a vaporiser to burn paraffin I have patented and fitted to my  $\frac{3}{4}$  h.p. single-cylinder motor cycle.

The vaporiser A is fitted on the top of the exhaust valve cap E and held down by a central stud B. It has an inlet

C for carburetter attachment, and an outlet for copper pipe D conveying the vapour to the inlet of the cylinder.

It will be seen that this vaporiser will fit nearly any machine, with little alteration and using the same carburetter.

Previous to fitting the vaporiser I ran about 400 miles on half paraffin and half petrol (my carburetter being supplied with hot air), but I found that the paraffin worked its way past the piston, with bad results to the bearings, but there is no trace of paraffin passing the piston when using the vaporiser. I have run about 360 miles on paraffin alone, pulling a heavy sidecar, the average consumption being from sixty to seventy-five miles per gallon, the price of this being 1s. against 2s. 9d. if I use petrol.

FRED WALKER.

Sir,—The following may be of interest to your correspondent Mr. H. A. Bromley.

Some years ago I tried some experiments with hot wires in the induction pipe of an old twin Rex, accumulator ignition, and B. and B. carburetter. The arrangement had the following disadvantages:

1. When warm the wires, of course, became slack, and there was a tendency to "short" and set fire to the carburetter.
2. It took a fairly heavy current to keep the wires warm enough to do any good.
3. The warmer the mixture, the less you get into the cylinder per stroke. This, of course, also applies to a warm-air inlet.

Much better results were obtained with a small coil of wire wound round the jet, and I am thinking of resuming experiments in this direction now, though not with electricity. Some of the old carburetters, I remember, had exhaust jackets round the base of the jet, and I have often wondered why these were discarded.

Sir,—I am sending you a rough sketch of a fitment I made some three or four years ago, which I used for running on petrol and paraffin. At that time the usual procedure

**Double Float Chamber**

Double float chamber design by J. McLellan.

was to unscrew the union to the float chamber and run the paraffin off, unless one had run it off some time previous to stopping, which in nearly every case I forgot to do, and then to fill in the petrol at the top of the chamber. You

see I did not have a spare tank, but carried the petrol in a bottle in my pocket. You will see that by turning off the paraffin tap and pulling the pump handle the float chamber is emptied, when the three-way tap is turned on for the petrol to fill up the chamber, or such quantity as is desired.

I made my pump out of an old inflator, which acted very well.

I thought perhaps some other reader would be glad of the suggestion, seeing petrol is so dear, and there are cheaper fuels on the market. I should say it would be just the thing for fitting to a Binks when using his fuel, and when easy starting is wanted.

JOHN McLELLAN.

#### Piston Tap or What?

Sir,—I, too, would like to give you my experience. My machine was a 1915 (August) 5 h.p. Indian, which, I might say, gave me the greatest satisfaction, being always extremely easy to start, very flexible, and would do 65 m.p.h. on the road. However, after running it for about 4,000 miles under very trying conditions, I noticed the same knocking, or tapping, that your contributor mentions. At first I put it down to excessive tappet clearances, but after very carefully adjusting these, I found no appreciable difference. Then I found that my front chain was slack, so I tightened it, and found that the tapping was ever so much better, but was, nevertheless, quite noticeable when running on pilot jet slightly up hill and on full advance. So I finally took the engine down, but at first I quite failed to find any cause. The big ends were perfect and the small ends were quite tight. Finally I removed the rings from the pistons and tried the fit in the cylinders, and I found that the back piston was quite slack in the cylinder, which, I presume, was the cause of the knocking referred to. The reason for the back wearing more than the front I attribute to the fact that the oil from the mechanical pump is all led to the front cylinder, and on one occasion I ran the machine short of oil, and so the small amount of oil that did reach the engine went to the front cylinder, and, in consequence, the back cylinder got practically none. I got rid of the machine after that in exchange for an 8 h.p., but for the 5 h.p. Indian as a solo mount I have nothing but praise.

D. W. CARTER.

#### A Trip to Imbros.

Sir,—Just a few remarks on a letter published by you in your issue of April 27th from P.O. G. L. Rossiter, R.N.

armoured cars, in which the following appears: "A little trip across the water to Imbros, in November, gave me an opportunity to try a Clyno outfit, which was being used as a sort of speed delivery van for aeroplane spares, mails, and, in fact, any old 'clobber.' It was a great joy to ride something with two fairly hefty cylinders on some sort of a road."

Now if your correspondent can let us know when he experienced that "great joy" we should be extremely interested, as at the time to which he refers we were in charge of the Clyno outfit mentioned in his letter, and can vouch for the fact that up to January 25th no one but ourselves, and very occasionally one officer, ever drove that 'bus, so you will see that he is possessed of an unusually vivid imagination.

We never find your excellent paper anything but instructive as well as amusing. It is in great demand here among the devotees, as everywhere else, and regularly goes the rounds every week.

May we ask you to do us the favour of publishing this correction?

W. W. MACONNACHIE.

L. MATHISON.

G. P. OSBORNE.

#### Foot Control of a Countershaft Gear.

Sir,—I have before me a copy of your most excellent paper, which is read from cover to cover by most D.R.'s out here.

I should like to pass a remark on an article, published in the issue of *The Motor Cycle* for June 1st, re the re-adjustment of gear control from hand to foot on the countershaft Triumphs.

The point I wish to impress is that this idea has come very late in the day. The D.R.'s of this Division, when being fitted out at Leamington, were the very first to receive countershaft Triumphs, in February, 1915, actually going to the Coventry works and riding them away; and before we left on "active service" in March, 1915, the majority had adopted the foot control, making precisely the same alterations as illustrated in the article from the Frenchman.

On arriving in Egypt, and later on at Gallipoli, we found that this alteration was essential, as it was impossible to let go the handle-bar in order to change gear.

I might add that our D.R.'s were the first motor cyclists to land on, and the last to leave, the Peninsula, and there are still ten of the "Old Guard" out here; two of those, after fifteen months' "active service," have not yet caught a glimpse of dear old "blighty."

Our praise cannot be too high for the trusty Triumph; its durability is marvellous.

E. BECK (CPL.).

Div. Signals, B.E.F.

[The question of foot control for countershaft gears received attention in *The Motor Cycle* some time before the description of the French Army motor cyclist's adaptation which appeared in our issue of June 1st. Nevertheless to Cpl. Beck's section must be awarded the credit for the first alterations effected.—ED.]

#### The Noise of Valve Gear.

Sir,—I was interested to see in your edition of March 23rd a description of a "Bundobust" to reduce noise and wear on valves, tappets, etc. I tried a similar arrangement to that described by your correspondent, but found it unsatisfactory, and I finally evolved the following (probably it is not original) fixture shown in the sketch, which may prove useful to your readers.

Essentially it consists of a thin case-hardened thimble fitting closely on the top of the tappet, and in between the two are packings of rubber, fibre, and, finally, tin discs. The rubber should be soaked in oil till it gets into a semi-liquid state. The arrangement is of particular value in non-adjustable tappets; also there is absolutely no necessity to have any clearance whatsoever between valve and tappet.

## PHENIX SIDECARS.

Well-thought-out Chassis by an Old-established Firm.

Examples of Phoenix sidecar chassis. That on the right is specially built for use with spring frame Indian models.

**T**HE manufacturers of the Phoenix sidecars were among the pioneers of the motor cycle industry, the founder of the business being Mr. J. Van Hooydonk, who is still a prominent member of the Motor Cycling Club, though his firm no longer makes motor cycles. The works where Phoenix sidecars are constructed are those in which the early Trimo first saw the light in 1902.

One of the first models which we inspected was a large double-seated sidecar which will take two adults. The backs of the seats are well upholstered, and a door is fitted to the front, there being also a space left under the front seat to provide room for the feet of the occupant of the back seat. This sidecar has a drop frame, and is designed to be

attached to the machine at four points. The body is carried on C springs provided with long shackles, the frame being stayed by four cross-members stiffened by a longitudinal backbone. The wheel hub is of large size. It is interesting to note that this sidecar is guaranteed to carry 40 stone.

### A Spring Frame Model.

Another speciality is the Phoenix Model 190, designed for the spring frame Indian. A special form of attachment is supplied to render it suitable for this particular make, it being attached at the rear to a lug under the saddle, and also to the bottom of the seat post under the accumulator box. It is fixed at two other points to the machine. The chassis is built throughout of the best weldless

12-gauge steel tubing, and is provided with heavy lugs. The tyre is a 28 x 3in.

There was also shown to us a model specially intended for Harley-Davidson motor bicycles, the chassis of which is provided with a large luggage grid behind. The 28 x 3in. wheel is enclosed, and a withdrawable spindle is fitted to the hub so that the wheel can be easily detached in the case of a tyre repair being necessary.

Altogether Phoenix Motors, Ltd., have about 100 sidecars in stock, and many of these being different models, the customer has ample choice. The workmanship is good, and the sidecars are thoroughly practical vehicles of excellent design. Numerous examples fitted with box bodies are used by tradesmen for the delivery of goods.

### A NOVEL MAGNETO.

**A**mericans are nothing if not enterprising, and no doubt a desire to strike something original in the magneto line has led to this, the latest feature of the Schickel lightweight—a small two-stroke, which has a considerable sale in the States.

Following on the lines of the Ford flywheel ignition device, the Schickel Motor Co. has produced a magneto which is enclosed in, and forms part of, the outside flywheel. Attached to the

case, and rotating the plate slightly. A small inspection hole in the wheel, with a movable cover, is intended to allow examination of the contact points. It is certainly a novel idea, but whether it is a step in the direction of the perfect magneto remains to be proved.

### THE MUSTIKON PATCH IN USE.

**S**INCE describing the Mustikon repair outfit we have carried one of these with us on every machine we have driven in the meantime, but until the other morning it acted as an exceedingly good mascot, and the only tyre trouble we had experienced was a leaky tyre valve.

However, when out for a ride recently we found that we had to take out the tube within two miles of the start, and discovered an excellent puncture with which to experiment. This was a pin projecting about 1/16 in. through the tube. Following the instructions given with the Mustikon outfit, we took the scissors supplied and neatly cut a small hole in the tube. We then turned to the solution tin, only to find it dry. Fortunately, the machine was supplied with another outfit, so we dipped the mushroom patch in the solution belonging to this, and after two attempts had no difficulty in inserting it in the hole. In a few minutes the outfit was packed up, and a beautiful repair made, which, up to the time of writing, has given no trouble, and we expect none either.

### TWO GOOD ELECTRIC LAMPS.

**M**ESSRS. BLERIOT, of 53, Long Acre, W.C., have recently placed on the market excellent side and tail lamps for use on the high-class sidecar combinations which are provided with electric lighting. As one would expect from so famous a firm, the workmanship

Bleriot side and tail lamps for electric outfits of passenger motor cycles.

and finish are of the highest quality, while the same may be said for the solidity of the lamps, the metalwork being substantial and strong.

The tail lamp is shown with the bulb withdrawn, indicating the size of the screw which enables one to obtain a good grip of the holder for the purpose of removing the bulb. Owing to the large size of the orifice the interior of the lamp is easily cleaned. As will be seen from the illustrations, the lamps are neat in outward appearance, and have no projections to make cleaning difficult.

An American magneto contained in the outside flywheel of a two-stroke lightweight.

inside of the rim of the wheel are a pair of permanent magnets. On a plate, fastened to a boss on the crank case, are carried the armature coils, contact breaker, and the condenser.

Timing is effected by loosening the clamps attaching the plate to the crank

## MOTOR CYCLES FOR SALE.

## Indian.

**INDIAN 1916** 5hp. Combination, 3-speed, dual controlled clutch, Binks and Indian carburettors, Lucas rear light, head light, horn, speedometer, spare valve, tube, plugs, and others, mileage 1,900; cost £96, must sell before 24th; £69.—Brooke, Joiner, Queen's Mill Rd., Huddersfield. [X2366]

**INDIANS in Stock**—Latest models, Powerplus combinations, sporting Powerplus 3 speeds models, standard 7hp. overhead inlet combinations, with lighting set, the famous 5hp. 3-speed double-purpose mount, and 7hp. clutch model road racer.—P. J. Evans, John Bright St., Birmingham. [X2339]

## James.

**JAMES No. 6** Combinations in stock; no waiting.—Colmore Depot, 261, Deansgate, Manchester. [6026]

**COLMORE Depot**, 261, Deansgate, Manchester, have in stock complete range of James motor cycles. [X2189]

**1916 James**, 2-speed, 2-stroke, £38/12/6; another shop-soiled, horn and lamp fitted, bargain, £33.—Bunting, Harrow. [7146]

**1915 1/2 3/4hp. James Twin**, only used since Christmas, 3 speeds, and clutch, front and rear light, horn, etc.; £52/10.—Box 554, c/o The Motor Cycle. [X2189]

**1914 1/2 James**, 4 1/4hp. 3-speed, Watford speedometer, De Luca Canoelet sidecar, with silencer, wind screen, 3 lamps, many spares, mileage 4,000, magnificent turnout, like new; bargain, £52/10.—Burridge, High St., Watford. [6942]

## J.A.P.

**2 3/4hp. Jap-Matchless**, regular T.T. flier, grand condition; bargain, £20.—Bunting, Harrow. [7147]

**4hp. J.A.P.** Senspray, Bosch, P. and H. Brooks, very fast; £30, no offers.—70, Sussex Rd., Holloway, N. [7179]

## J.E.S.

**J.E.S.**, 1914, 1 1/2hp. 3-speed Sun cycle, fork girders, splendid order; £12.—68, Clevedon Rd., Weston-super-Mare. [X2225]

## Juno.

**JUNO**, 2 1/2hp. 2-stroke, late 1915, splendid condition, only wants seeing; evenings; offers.—Strong, 41, Halstow Rd., East Greenwich. [7184]

## Kerry.

**3 1/2hp. Kerry-Abingdon**, 2-speed, sidecar, spares, cover, 3 tubes, etc.; must sell, joining up; £25.—Hine, Mills, Hemlock. [X2274]

**KERRY-ABINGDON**, 3 1/2hp. 2 speeds, clutch, and cane sidecar, very good condition; £25.—Chaufeur, Stubbings, Maidenhead. [7173]

**1913 Kerry-Abingdon**, 3 1/2hp. a, coachbuilt sidecar, Sturmer-Archer 3-speed (new), B. and B. carburettor, recently thoroughly overhauled; £38.—89, Grange Rd., Ramsgate. [7196]

**3 1/2hp. Kerry-Abingdon**, 1912, 2-speed and clutch, chain and belt drive, good tyres, enamel and plating nice condition, running well; bargain, £22/10.—Thomson, 85, Church Rd., Willesden. [7223]

**KERRY-ABINGDON**, 3 1/2hp. 1912 overhauled, hand clutch, long wicker sidecar, new Dunlop belt, etc.; Jones speedometer, lamps, etc., splendid condition; bargain, £23, or exchange lightweight.—3, Albert Quadrant, Weston-super-Mare. [X2224]

## Levis.

**1916 Levis**, new, but soiled; £25.—Pitts' Stores, Red-ditch. [X2407]

**LEVIS 2 1/2hp.**, 1915 1/2, new condition, all accessories; £23/10.—95, High St., Bexley, Kent. [X2017]

**1916 Levis Popular**, £32, in stock.—Williams, A.J.S. Agent, Chapel Ash Depot, Wolverhampton. [X2295]

**LEVIS**, 1914-15, 2-stroke, splendid order throughout; £17/10.—Speechley, 45, Church Rd., Acton. [7243]

**COLMORE Depots**, Birmingham and Leicester, for delivery of all models of Levis motor cycles from stock. [6804]

**LEVIS 1915 Popular Models** from stock; £32 cash, 50 or gradual payments.—Wauchope's, 9, Shoe Lane, London. [7151]

**LEVIS**, 1916, 2 1/2hp., shop-soiled only; £33, list price £40, bargain.—Colmore Depot, 31, Colmore Row, Birmingham. [X2151]

**LEVIS 1916 Popular Model**, 2 1/2hp.; £32; in stock; immediate delivery.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., London. [7004]

**LEVIS Popular**, new; special bargain; cannot repeat: £28 cash; gradual payments 2%.—Referee Cycle Co., 332, High Holborn. [0764]

**LEVIS Popular Model**, new, but slightly shop-soiled; £26/17/6, special bargain.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., London. [6998]

**1915 Levis Popular**, little and carefully used, lamp, horn; £20, complete, bargain.—Frank Boden, Confectioner, Matlock Bath, Derbyshire. [X2316]

**LEVIS 2 1/2hp.** Popular, brand new, 1916, complete with lamps, horn, and numbers; owner noticed; £20.—Gorleston, St. Albans Rd., Kingston. [X2335]

**LEVIS 1915 (December)** Popular, perfect condition, speed, Brooks saddle; 25 gns.; owner going abroad.—L. J. Wallis, Royal Oak, Biggleswade, Beds. [X2305]

## Sixpence a Gallon on Petrol.

**S**IXPENCE per gallon on petrol must be regarded as a success from a motor cyclist's point of view. The stir created when the new rates of taxes on motor cycles, varying from £2 2s. to £4 14s. 6d., were promulgated has no doubt had good effect, for not a week has passed but this journal has been able to provide evidence of the unfairness of the proposals. Moreover, as will be recalled, *The Motor Cycle* addressed a letter to the Chancellor of the Exchequer, pointing out that his proposals were "unjust and inequitable," and quoted some of the anomalies which existed. Stress was laid upon the fact that "motor cyclists would be called upon to pay £4 14s. 6d. for their machines, whereas several makes of small light cars weighing four or five times the amount of a motor bicycle would get off for £4 4s." Examples showed that basing taxation upon the bore of the engine only is quite unfair in the case of motor cycles. We then suggested the alternative of 10s. 6d. per horse-power, one horse-power being represented by every 125 c.c. capacity. The Chancellor promised that our proposals would receive attention.

Mature consideration has brought about the adoption of a petrol tax which, we think, will meet with general satisfaction. Motor cyclists can congratulate themselves that, in addition to owning the cheapest motor vehicle ever devised, they likewise possess the most economical mount, so far as petrol consumption is concerned.

Straws show which way the wind is blowing, and a paragraph on page 542 of our issue of June 8th, reproduced below, would convey to the observant man more than we could blatantly announce. It ran:

### A Petrol Tax Only.

To abolish the new taxes and put an additional tax on petrol alone seems to be the most favoured system, according to our post bag. At present, no matter whether a man uses 500 miles of roads in a year or 5,000, the tax is the same. Road

damage, too, would be automatically adjusted, as the heavier vehicle naturally consumes a much greater quantity of fuel.

## The Economy and Utility of the Motor Cycle.

**T**HIS issue mainly consists of a tribute to the sidecarrier, a branch of the industry that owes its development chiefly to the war. The commercial motor cycle was, of course, in existence several years ago, but not until August, 1914, did it receive the attention it deserves both from manufacturers and users. To a great extent this recognition of the sidecarrier was in both cases compulsory. When war broke out many manufacturers concentrated half-heartedly on commercial editions of their touring machines with a view to keeping their works fully occupied, and it was, perhaps, only the advent of Government control that put a stop to much greater activities in this direction. On the other hand, the small tradesman has been forced to adopt the sidecarrier by reason of labour shortage and the wholesale commandeering of horses. It is safe to say that those traders who have been driven by force of circumstances to the commercial three-wheelers are regretting now that they did not adopt them much sooner, so satisfactory from an economical and utilitarian point of view have been the results obtained.

Besides dealing at some considerable length with the purely commercial vehicle, we are able to provide abundant evidence in this issue of the many advantages of the motor cycle either as a solo or passenger machine in general business and professional use. Not the least attractive features, too, are the proofs of the economy of the motor cycle, either for touring or business. In view of the additional sixpence per gallon on petrol, this is of paramount importance, as the motor cycle is easily the most economical vehicle on the road in the matter of petrol consumption.

# A Mount for the Medical Man.

## SOME ADVICE ON THE CHOICE OF A SUITABLE MACHINE.

**M**OTOR cycles have met with such universal popularity among doctors, and the advantages they offer as a quick and economical way of getting about are so obvious, that in this article it is hardly necessary to quote professional opinion as to their value. This might, moreover, be misleading, for almost every doctor who uses a motor cycle is quite convinced that his make of machine is "the one and only" for the work, whereas one man's medicine might in reality prove another man's poison. A more useful purpose than bolstering up the cause of the motor cycle might be served by giving a little professional advice which may be of assistance to those who are "still contemplating" the use of a two or three-wheeler. After all, it is not the man who uses a machine we are after. It is (1) the absolute Juggins, so far as motor cycles are concerned, who wants to buy but who does not do so because he is not quite sure what to buy; and (2) the man who has employed a car, but who wishes to employ a motor cycle in order to economise.

Doctors, therefore, may be divided into two classes as motor cyclists: (1) The man who does everything by motor cycle, and (2) the man who does most things by car, but who employs a motor cycle occasionally and chiefly for the use of his manservant.

### The Usual Question.

"What make of machine would you recommend?" When the machine is used as the sole means of progression, and is in use practically all day winter and summer, it is to be noticed that most medical men employ the  $3\frac{1}{2}$  h.p. single-cylinder chain-driven machine, which is the handiest and probably the most dependable class of mount one could recommend. A "big twin" sidecar outfit, however, requires a minimum of attention for actual service rendered, and can be depended upon for giving one year's sustained use without attention in the way of renewals or repairs over a distance of, say, 4,000 miles.

At 6

A chat with local celebrities. Incidentally, the two elderly villagers give one the impression that they have little need for a doctor.

### The Question of Weight.

Unless one's riding includes a good deal of hard riding with numerous non-stop journeys of, say, six or seven miles, this class of mount is, perhaps, superfluously heavy and powerful. As a runabout for use in a thickly populated district something more suitable might be arrived at, but in the mountains of the North, particularly by the mechanical-minded Scot, the heavy mount has met with general popularity. This is probably because it is more comfortable to ride and more easy to control than the average lightweight.

The influence of environment is not, however, so noticeable to-day as it was a few years ago, for the lightweight of to-day will do more than the heavy touring mount of yesterday.

As regards cost of upkeep, I am inclined to think that there is very little in it as regards the various solo machines. A badly tuned "baby" will cost more to run than a well-tuned  $3\frac{1}{2}$  h.p. single, many of the babies possessing truly infantile thirsts, whereas the average  $3\frac{1}{2}$  h.p. four-stroke is very economical in this respect. Unquestionably the cheapest machine on the road is the small four-stroke, but the difference between one and another, excluding depreciation, is so slight that it need hardly enter into one's reckonings. Luck, and one's own mechanical abilities, are the deciding factors.

Heavy sidecar outfits naturally cost more to run than solo mounts, but the convenience of being able to carry all one's equipment, including waterproofs, dusters, etc., is well worth it.

One big advantage of the modern  $3\frac{1}{2}$  h.p. three-speed single is that, while it will take a sidecar anywhere, it is ideal for solo use during the summer.

A useful carrier when delicate instruments and breakable goods are to be carried. It will be observed that it is attached to the saddle, and is therefore sprung with the rider.

**A Mount for the Medical Man.—**

The lightweights and semi-lightweights are limited to solo use, but these machines are marvellously efficient, and will stand any amount of hard and continuous riding. The great advantage of the two-stroke lies in its handiness; it can be paddled off from the saddle, left by the kerb like an ordinary pedal cycle, and pushed in and out of the motor house four or five times per day without undue exertion. For doctors who propose using their machines only occasionally, and maintaining them chiefly for the use of a manservant, the lightweight is unquestionably the

A light and serviceable third wheel attachment. Mounted on a Lewis Empire lightweight chassis, the large box is for carrying a medical kit, and the small sloping box in front for carrying tools and spares. The body can be removed in two minutes and the light coachbuilt passenger body substituted.

thing. Impress upon the man that he has a cycle to look after in addition to a motor, and all will go well. In a really mountainous district a change-speed gear is necessary, and with this fitment the machine should climb anything in reason.

**Small Four-stroke Engines.**

The small four-stroke twin has met with considerable popularity among professional men, as well it might. If properly tuned, a machine of this class consumes an almost negligible quantity of fuel, is speedy on the level, and delightful to ride at all times. At low speeds it is more pleasant to handle than the two-stroke in average tune, but generally it requires slightly more attention.

The small four-stroke "single," on the lines of the A.J.S. lightweight, possesses most of the advantages of the "big single," except that it cannot be used for sidecar work. Those who have no mechanical aptitude, but who particularly desire something light, economical to run, and absolutely dependable, would do well to consider the possibilities of the small single-cylinder four-stroke.

**Springing and Vibration.**

After the war many motor cycle manufacturers will build spring frame models, and these will undoubtedly find a ready sale among doctors. To the man who knows nothing about motor cycles it may be pointed out that, given two machines exactly alike, except that the rear wheel of one is sprung and on the other it is not, then the former will be far the more comfortable to ride. Hence a spring frame motor cycle makes a special appeal to a medical man. This is borne out by the experiences of a Chester physician who has been using a spring-framed machine (the Edmund-Jap) as a tender to his car. He has found that the use of a rigid frame bicycle in his professional duties has been greatly limited by the vibration on pot-hole roads, and this is not noticed on a spring frame machine.

**The Desirability of Leg Shields.**

There is but one obstacle between the medical man and the motor cycle, and that is the ever-apparent necessity of having to don overalls. He observes the train of motor cyclists which filters from the cities during holiday times, and he decides that "if I am to be one of these I will wait till I can buy a car." But the makers of accessories have catered so liberally for the professional-man that there is no need for him to appear as one of these. As regards one's lower members, which present the greatest difficulty, half the nuisance is removed by the use of clip-on leggings, which can be donned or shed in a few seconds.

Winter mud is easy to contend with by equipping one's machine with leg shields, etc. The dust of summer presents greater difficulties. The winter shields are then worse than useless, for the disturbance they create in the atmosphere causes the dust to whip in from the rear, and the only practical way is to use cotton overalls, which can be washed periodically.

H.M.B.

**YET ANOTHER USE FOR THE MOTOR CYCLE.**

The Detroit, U.S.A., police motor squad and their Harley-Davidsons. Nearly all the big cities of the United States have a section of motor cycling police, one of their duties being to prevent scorching in the towns and suburbs. As a result of this they are commonly referred to as "speed cops."

### Two-wheeled Machine Gun Limbers.

Some of our readers have been struck by the ingenious Hendee machine gun outfit, illustrated in our issue of June 8th, and wonder that a similar idea did not occur to our own service. I am in a position to state that the War Office turned down a similar notion submitted by a private inventor comparatively early in the war. Presumably they were of opinion that the detachable two-wheeled carriage, whilst doubtless admirable for mobile warfare, such as Mexico may furnish, was hardly suited to the stationary campaign in Flanders. Possibly they were also influenced by the large quantity of the other pattern (fixed sidecar) already in use or on order, and did not wish to multiply patterns with the consequent complication of depot stocks and replacement work.

### Daylight Saving in Rural Districts.

I don't know whether Hodge is sly or stupid, but a number of farm labourers have evidently misunderstood the new time laws. I have met several unlighted farm carts in country lanes since the clock was put forward, and I advise readers who are traversing rural lanes to be on the *qui vive*. Unlighted carts were always pretty common off the main roads, as the inhabitants of a village usually know which is the local constable's courting night, and don't trouble to light up when he is at the other end of the parish; and now that lamps are not required until so late, yokels seem to have written them off as useless luxuries in war time. Anyhow, it helps one to realise a little more of what some D.R.'s go through.

### Four-stroking.

Several readers show by their letters that they have never genuinely comprehended the nature of four-stroking. The charges inhaled by a four-stroke engine are of approximately similar nature; and if one is too rich, too weak, or too impure to explode, it is expelled unburnt on the next exhaust stroke, and succeeded by a following charge which is sure to be practically identical in character, so there is no reason for a four-stroke engine to eight-stroke. The sequence of events on a two-stroke engine is quite different, as (a) a number of factors may vary the nature of successive charges within limits, and (b) an unexploded charge is less completely scavenged than an exploded charge; in a two-stroke engine the exploded charge is exhausted very largely by its own expansion, and the piston, so far from assisting in the first period of the exhausting process, is descending. A charge which remains unexploded has comparatively little expansive force, and a large percentage of it remains in the cylinder, and combines with the vanguard of the next body of gases rushing up the transfer pipe to form the succeeding charge. So whenever the following charge happens to correct the mixture of the un-

exploded charge, the engine must fire regularly at each alternate revolution until the mixture regains the correct ingredients. It would be interesting to know from one of the experts who has studied carburation with glass carburettors and piping whether the advance guard of a fresh charge from the carburetter usually consists largely of air. Otherwise, why does the mixture of (a) a rich unexploded charge, and (b) the front end of the succeeding charge, usually give a satisfactory explosion?

### Gear Boxes v. Flexibility.

The universality of variable gears, coupled with the tendency towards luxurious and weighty specifications, is destroying or at least reducing one of the pleasantest features formerly characterising the average motor bicycle. When a  $3\frac{1}{2}$  h.p. machine scaled under 180 lb., it was a very flexible machine to drive on a single gear. No doubt occasions were numerous when one sighed for a change speed gear, and other heavy fittings; but on easy undulating roads devoid of really severe hills, the light single-gear  $3\frac{1}{2}$  h.p. was—and still is—a most delightful machine to drive. On throttle control alone the speed could be varied from at least 5 to 45 m.p.h. on the one gear, and the machine accelerated well. The sensations were analogous to those of driving a 50 h.p. six-cylinder car, so far as speed range on one gear was concerned. One of the newest  $3\frac{1}{2}$  h.p. machines I have ridden is fully up-to-date in all its specification, and scales 3 cwt. Intrinsically it is at least as flexible as the old-timers, or even more so; for, thanks to a well-plotted set of gear ratios, it can be driven at any speed from 2 to 60 m.p.h. But it is only on our best main roads that it can be kept on a moderately high gear for any distance; ratios of from 4 to  $5\frac{1}{2}$  to 1 are useless to it when slowed against an insignificant gradient; and it does not really enjoy picking up from a slow on the level with a gear of 5 to 1 or more in operation. Its absolute flexibility may exceed that of the old single-gear T.T.  $3\frac{1}{2}$  h.p.; but in actual riding its practical flexibility seems to be much less, because one is always dropping on to some such ratio as 7 or 8 to 1 in order to recover the engine revolutions. Its engine is infinitely superior to any of the old-time 500 c.c. patterns, and its deficiencies are wholly ascribable to its tremendous weight. I can quite comprehend the taste of a man who still clings to a light T.T. mount, with a fixed gear or a Philipson pulley; the ultra-heavy, ready-for-any-emergency tourist machines of to-day, many of which could pull a sidecar up Honister if they could secure a tyre grip, deprive us of one of the main delights of motor cycling—the sense of infinite power available at the twitch of a finger. There should always remain a small market for the lighter and livelier types.

## Women's Work in the Army Service Corps.

By ANNA BLAKISTON.

FOR some time women have been employed in certain branches of the Army Service Corps so that men might be released. I was a forwarding supervisor in the forage department for several months, and was engaged in different parts of Yorkshire. Although the work *can* be done with an ordinary push bicycle, I need not mention here the many advantages of a motor cycle. As a matter of fact, for six weeks I could not have done my work without my motor cycle, as I was riding forty-odd miles a day. And such a distance on a pedal cycle is beyond the capacity of an ordinary woman when it forms but an item of the day's work. On a motor cycle, on the other hand, it is simply a pleasing interlude in the day's proceedings.

### Hay for the Army.

For all-weather riding on roads which vary from fair to very bad indeed, a lightweight is preferable, unless one is either a trick rider or a sidecarist. Even with my little lightweight I had several bad skids. I might add I was never any the worse for them. I was very surprised the first time the bicycle

skidded absolutely round. It was a frosty morning, and the road was covered with a thin, slippery layer of ice, so really my little two-stroke Revere had every excuse for its behaviour. Next time out I was more cautious.

My work consisted of making arrangements at various railway stations for sending off clover, hay, and straw for Army use in England and abroad. I then had to supervise the loading, sheeting, and roping of the

trucks, label the trucks, and advise on Army forms—all very simple when you know just how it's done! One does come across porters who flatly refuse to load in the way you require or to sheet and rope just when you tell them to. Well then you must remember that you are doing a man's work, and it is up to you to assert your authority and see that the work you have undertaken is properly carried out by mere man.

The photographs show loading at one of the stations and the steam baler. May I add that the baler I was attached to at that time was reputed to be the fastest baler in Yorkshire.

(Top) Loading clover.

(Middle) The writer of the accompanying article, Miss Blakiston, in her capacity of forwarding supervisor in the A.S.C., talking to a bale supervisor. Her machine is a two-stroke Revere.

(Bottom) At the weigh-bridge. Giving the station-master the consignment note.

# THE SIDECARRIER ANALYSED.

Its Possibilities—Costs of Horse and Motor Compared—Suggested Body Designs for Different Trades.

**T**HE advantages of the motor cycle sidecarrier for trade delivery work are so many and important, and the new conditions arising out of the war are causing so many businesses urgently to require new methods of cheap and quick delivery, that the present moment is an extremely appropriate one to call attention to the value of the sidecarrier for all who have to make regular and quick deliveries over wide areas.

Great numbers of traders have had their horses commandeered for military purposes, in many trades business has been good and delivery requirements increasing, notwithstanding the war, so that new means of delivery are pressingly wanted. Small motor vans have been adopted by many, but there are numbers of smaller traders whose requirements do not warrant the purchase of a motor van, and for these the sidecarrier would be an eminently suitable proposition.

## The Question of Cost.

In the adoption of any new method the question of cost is one of the first for attention, and a consideration of the comparative figures of horse delivery and motor sidecarrier delivery, both as regards capital outlay and running expenses, should do much to convince traders of the great advantages of the motor cycle in all cases where large quantities of parcels have to be delivered and a good mileage covered. In this connection it is important to remember that a motor cycle delivery combination will do greatly more work than a horse and van. A couple of sidecarriers of only moderate capacity will do the work of three horses and light vans, while if a sidecarrier of large capacity be employed, such as is now obtainable, a single motor cycle delivery combination will do the work of two horses and carts, covering a greater mileage, and delivering more goods with greater speed and efficiency, and more satisfaction to both the trader and his customer.

## Capital Outlay.

The capital necessary to expend on a motor cycle delivery combination capable of doing the work of two horses will be about the same as the amount involved in the purchase of a single horse and van, and if a second-hand motor cycle with a new sidecarrier be secured through a dealer the cost will be appreciably reduced and the dealer, who is a skilled expert, will be willing, as a rule, to set up the combination and give his personal guarantee of the serviceability and perfect running order of the combination at the time of delivery.

## Running Expenses.

For tradesmen delivering parcels of goods sold which vary in quantity from day to day the following comparison of the approximate figures of weekly running expenses of horse delivery by two horses and vans and motor cycle delivery by one motor cycle will be useful, and will show

*This article is written mainly for the man who is contemplating the adoption of mechanical transport for the delivery of light goods, and it sets forth the particular claims of the motor cycle sidecarrier—a type of machine unequalled for the rapid and economical delivery of loads up to 3 cwt. at a time. It should be read in conjunction with another article in this issue embodying the actual experiences of users of these handy three-wheelers in various trades.*

the service to be expected from a motor cycle delivery combination. In practice it will probably happen that at times the sidecarrier will be either overloaded or underloaded and the journeys shorter or longer than those specified, but the secret of success is to have a sufficiency of work and a good mileage.

## WEEKLY COST OF HORSE DELIVERY.

Horse keep: Fodder and bedding, stable materials, farriery, and veterinary ex-

penses, for two horses at 16s. per week ...	£1 12 0
Wages: Two men at 24s. per week ...	2 8 0
Horse renewals at £8 per horse per annum, say 3s. per horse per week ...	6 0
Repairs and depreciation: Van and harness at £5 each per annum, say 2s. each per week ...	4 0
Stable rent at 5s. per van and horse per week ...	10 0
	<hr/> £5 0 0

In these figures nothing is charged for occasional hire of spare horse to replace animals sick.

## WEEKLY COST OF SIDECARRIER DELIVERY.

Petrol and oil (sixty miles per day) ...	£1 3 0
Wages: one youth ...	1 1 0
Tyres (at £7 per set for about 4,000 miles) ...	12 6
Depreciation and repairs ...	7 6
Total ...	<hr/> £3 4 0

In twelve months the expense of horse delivery will be £260, and of motor cycle delivery £166 8s., or a saving in favour of the motor cycle amounting to £93 12s., practically the cost of the outfit.

For this expenditure of £3 4s. weekly the 6 h.p. delivery combination will easily make six journeys daily, each averaging five miles out and home, and carrying thirty parcels of an average weight of 10 lb. = 180 parcels a day, or 1,080 parcels per week, at an average cost of under 3d. per parcel. It should be borne in mind, too, that the expenses of motor cycle delivery are only incurred if there are goods to deliver, but all the expenses of the horse go on by night and day whether the animal is rendering service or not.

## Obtaining a Sidecarrier Outfit.

Although motor cycle manufacturers, deeply engaged with the demand for munitions, are turning out but few motor cycles for the present, the tradesman who is willing to give motor cycle delivery a trial need have no difficulty in obtaining a new machine and sidecarrier.

Most of the sidecar manufacturers also are able to give delivery of commercial sidecarriers capable of being used with second-hand motor cycles of all makes. A practical plan for the tradesman is to apply to his local motor cycle

# SIDECARRIERS IN EVERY TRADE.

### The Sidecarrier Analysed.—

agent, or one of the dealers who advertise in *The Motor Cycle*, stating his delivery requirements, and to receive the agent's offers and recommendations. If he has not got in stock what is exactly suitable, he will probably be in a position to obtain prompt delivery of it from his contracts with the makers, or from his knowledge of riders who have reliable machines for disposal. In any case, the services of the agent or dealer will be invaluable to the tradesman who is not a motorist, and will ensure the installation of the outfit under the best conditions for success.

### Some Points on Practical Guidance.

Here are a few points of practical guidance which will help the trader in making his choice. A  $3\frac{1}{2}$  h.p. outfit will be suitable for loads up to 2 cwt., and a 5 or 6 h.p. twin engine machine if it is intended to take heavier loads, say averaging  $3\frac{1}{2}$  cwt. The machine for heavy work should have chain transmission, the chains either wholly or partially enclosed. Great strength is required in the couplings between the machine and the sidecarrier. The couplings should have at least four points of connection, and the lugs to which the couplings are attached should be brazed on to and form part of the machine. The dealer will see that the outfit is sent out perfectly aligned, and the driver must see that proper alignment is always kept to ensure easiest running and avoid undue strains and possible breakages. A  $3\frac{1}{2}$  h.p. outfit, motor cycle and sidecarrier complete, may cost upwards of £70, a 5 or 6 h.p. outfit £90 to £100. It is more to the point to get the right article than to save a pound or two in first cost.

The sidecarriers offered by sidecar manufacturers are, as a rule, without internal fittings; but the manufacturers will make fittings to suit the buyer's wants. The motor cycle sidecarriers also are of good size—much larger than those generally used with pedal cycles. The tendency is towards larger sidecarriers of greater capacity, which is a desirable feature when large numbers of parcels are required to be carried. The Harley-Davidson sidecarrier measures 62in. long by 19½in. wide, and 19½in. deep; the Enfield sidecarrier, though not so long, is 22in. deep and 25in. wide, and, where required, sidecarriers of larger dimensions can be obtained. open with a top lid and door at one end, but, for some trades it would be well to have doors at each end and half the top formed to open, the remainder of the top being a fixture to secure strength, and the sidecarrier can be made in this way if desired.

The following suggestions of useful internal fittings for different trades, as shown by the accompanying diagrams, may be found of service to help the buyer in specifying fittings to suit his trade.

### The Draper's Sidecar.

Fig. 1 shows an arrangement suitable for drapers and departmental stores where heavy goods and light parcels that must not be crushed may have to be sent by the same sidecarrier. The fittings comprise two rows of shelves, adjustable as to height, running the length of the carrier and moving on runners so that the shelves can be drawn out and all parcels be easily accessible without disturbing others.

Heavy goods can be carried at the bottom, lighter packages on the shelves. Each shelf can be divided in the centre so that half the shelf can be withdrawn from either end. Large and tall millinery boxes can be accommodated by removing one of the half shelves, and a basket packed with china by removing two of the half shelves.

Fig. 1.—Design for a draper's carrier.

and packing in packets at the warehouse and to send cases to branches containing supplies of packets of teas, sugars, and the like all weighed and packed ready for delivery to customers. The rest of the shelves can be replaced, and the sidecarrier used with the shelves packed with parcels for delivery to customers as described in fig. 1.

Fig. 2.—A grocer's sidecarrier, showing shelves removed to allow the carriage of bulky packet goods.

top of the sidecarrier, which will ensure that the goods are delivered in perfect condition on the hottest days. One of the shelves is shown made of strong galvanised iron wire arranged lattice-wise, which allows the cold air to descend.

### The Butcher's Sidecarrier.

A serviceable arrangement of fittings to suit the butcher, poulterer, or fishmonger is shown in fig. 3. For these trades it is useful to have the sidecarrier lined with sheet zinc with riveted and soldered joints, which will enable the interior to be kept perfectly clean and sanitary without the necessity of frequently scrubbing the inside woodwork. A small ice box, marked A, should be arranged at the top of the sidecarrier, which will ensure that the goods are delivered in perfect condition on the hottest days. One of the shelves is shown made of strong galvanised iron wire arranged lattice-wise, which allows the cold air to descend.

These are only a few samples of internal fittings, and sidecar manufacturers will supply others for any special trade if desired.

### The Sidecarrier for Laundry Work.

In fig. 4 a special arrangement of the sidecar chassis is shown, permitting a large detachable skip to be mounted in place of the sidecarrier body for use by laundries. The full hamper can be packed by the hotel or receiving office and loaded on to the carrier in a few moments in exchange for an empty one, which also can be packed at leisure and exchanged in its turn.

This is also a good arrangement for bakeries who regularly deliver bread to agents and dairies; for flour and grain merchants who send small sacks and boxes of cereals to shopkeepers; also for wholesale tobacco dealers with branch shops, and even for railway companies at suburban and country stations where numbers of parcels are received by rail for local delivery.

As a rule, it may be taken that it will prove satisfactory and profitable to adopt sidecar delivery in any business where there are parcels to be delivered regularly over a radius of some miles from the shop or warehouse, and where the present cost of delivering such parcels approximates to £100 per annum. Traders who under these conditions are confronted with the war-time problem of difficult deliveries, owing to the commandeering of horses, will find it satisfactorily solved by the motor cycle and sidecarrier.

## "DELIVERING THE GOODS."

Experiences of Small Tradesmen with the Modern Light Delivery Vehicle.

**A** GOOD example of the satisfactory results that can be obtained from a sidecar outfit fitted with interchangeable commercial and touring bodies is provided by the  $3\frac{3}{4}$  h.p. Ivy-Precision owned by Mr. P. J. Chandler, grocer, etc., of Chelmsford Road, Old Southgate. This is a 1913 machine, fitted with two-speed N.S.U. gear, and it has been in almost daily use for eighteen months.

The dimensions of the box carrier are 2ft. 10in. long, 1ft. 8in. wide, and 1ft. 5in. deep. It is not at all a lengthy job to take this body off and replace it with a touring one. With the latter body Mr. Chandler has had some very enjoyable runs, including a five days' tour in which 650 miles were covered. But it is as a commercial vehicle that the owner has realised its worth, and since his staff of assistants has been greatly reduced owing to enlistments he has found the outfit more useful than ever.

On No. 2 spirit petrol consumption varies between sixty and eighty miles per gallon, according to whether the machine is on straightaway runs or delivering goods, and therefore constantly starting and stopping.

### Driven by Circumstances to a Sidecarrier.

**Q**UITE a number of tradesmen using sidecarriers would not be doing so but for the war. The wholesale commandeering of horses and depleted staffs have made many turn their attention to the three-wheeler, the result being a great wish that they had been introduced to the advantages of this handy little vehicle earlier. A Birmingham wholesale and retail grocer, Mr. C. H. Newlands, of St. Luke's Road, was almost driven to adopt a sidecarrier owing to circumstances of the above nature, and he is delighted

*Roughly speaking, the field of the delivery sidecarrier among tradesmen can be divided into two sections—the man in a comparatively small way of business using one or two machines, and the big stores which use them as tenders to large capacity vans. On this and the following pages several instances are given of the successful application of the sidecarrier by the small tradesman.*

A  $3\frac{3}{4}$  h.p. Ivy-Precision sidecarrier used by a Southgate grocer. The body shown can be changed for a touring one in a few minutes.

with the experiment. His experiences are as follow:

"A few years ago I used a horse and trap for my outside work. The cost at that time of keeping a horse was at least half what it is at the present, but my chief difficulty was to obtain a reliable driver. I therefore sold the turnout, and made arrangements with a contractor, soliciting orders personally on a pedal bicycle. Some of my journeys are long, and I often felt tired on returning, and little fit to commence counter work. This induced me to purchase a lightweight O.K., and so commenced my motoring experience. This little machine was an excellent mount, and rendered good service. I returned from my journeys fresh and in much shorter time.

"I had got over one difficulty, but was still in the position of thousands of tradesmen, i.e., worried over the problem of delivery. The hiring system was always a source of anxiety. Then came the time, owing to the war, of the almost impossibility of getting men at all, and one exceptionally busy week I had no means of delivery, and was obliged to go to the expense of hiring a taxi. I was determined that this experience should not be repeated, and my thoughts became centred on a Ford van. However, a friend to whom I mentioned the matter suggested a sidecarrier, pointing out the possibilities of an alternative touring body for week-end and holiday trips. "As an experiment I purchased a  $4\frac{1}{2}$  h.p. B.S.A. and passenger sidecar. Being not over-confident of the success of the commercial body, I got a carpenter to convert a strong foreign match-case into a temporary delivery box. I attached this to the B.S.A. sidecar chassis, and the bodies can be changed in about ten minutes. The outfit is proving much more successful than I ever imagined. I solicit my orders with sidecar, and use the box body for

### THE ADVANTAGES OF THE CONVERTIBLE SIDECAR.

(Left) B.S.A. used by C. H. Newlands, of Birmingham, for business on work days. (Right) The same bicycle with touring body attached for Sundays and holidays.

**"Delivering the Goods."**

delivering. At first it seemed strange delivering the goods personally, but I find customers appreciate the personal attention, and I have the satisfaction to know they have their goods in perfect condition; even eggs I carry without breakage.

"I cannot speak too highly of the B.S.A. My average loads are between 2 and 3 cwt., and with this weight I climb all the local hills, never using low gear except in traffic. Petrol consumption in traffic and delivery with constant starting and stopping is about 45 m.p.g. On a tour with my wife and two children we have managed 65 m.p.g. I cannot state definitely my weekly running expenses, but approximately I consider I am saving 15s. per week over previous forms of delivery."

**Laundry Delivery by Motor Cycle.**

**T**HE experiences of the Westwood Laundry, of Oldham, with a sidecarrier are instructive, in that they have been obtained with a machine that has been in constant use for nearly six years. The outfit, a 4 h.p. two-speed belt-driven Bradbury, was supplied to Mr. Andrew, of the Westwood Laundry, in August, 1910, and since then it has been used on an average four days a week, the weekly petrol consumption being three gallons. A remarkable testimony to the machine is that, according to the owner, only about £4 has been spent during this lengthy period on repairs and renewals, but this cannot include tyres.

AFTER SIX YEARS'  
CONTINUAL SERVICE

AND STILL GOING  
STRONG.

This 4 h.p. Bradbury sidecarrier has been used by an Oldham laundry for this lengthy period with satisfactory results.

**Half the Cost of a Horse and Van.**

**M**R. E. SELLS is a confectioner of Chesham, and uses a B.S.A. sidecarrier in his work with most satisfactory results. He has also a touring body which can be substituted for the commercial body in ten minutes. The dimensions of the carrier are 5ft. x 1ft. 8in. x 2ft., and nearly one hundred 2 lb. loaves can be carried at one time. The machine has now covered over 3,500 miles, and it has given no mechanical trouble.

The machine is a 1914  $3\frac{1}{2}$  h.p. three-speed B.S.A., and though there are many bad hills in the Chesham district Mr. Sells tells us that the machine climbs them all well, and it is seldom that the bottom gear is used. This is interesting, as showing that before buying a sidecarrier one should consider carefully the question of horse-power, so that a too powerful machine (meaning increased petrol consumption, etc.) is not bought. On the other hand, it is just as bad to buy a machine of too low power.

As regards running cost, Mr. Sells contends that his B.S.A. sidecarrier is just about half that of a horse and van. The machine does about 50 m.p.g., which is good for a delivery round entailing frequent starting and stopping. The weekly mileage is about 100, and on this basis Mr. Sells reckons 6s. 6d. for petrol and oil and 3s. 6d. for tyres, repairs, and renewals per week.

In addition to the actual saving in cost of running, a round that with a horse van took five and a half hours to

A smart-looking sidecarrier that in itself is a travelling advertisement for the owner, a Chesham confectioner. It is a B.S.A., and the experiences of the owners, E. Sells and Son, are recounted on this page. At week-ends and holidays a touring body takes the place of the one shown, the changing only occupying ten minutes.

cover is done with the B.S.A. in three and a half hours. This is a considerable saving, and an enterprising tradesman is thus enabled to extend the sphere of his business.

**A Well-proven Type.**

**A** SPECIAL Number, such as this issue of *The Motor Cycle* dealing with the commercial three-wheeler, could not be considered complete without some reference to the well-tried Auto-Carrier. This make of machine had well-established itself before the sidecarrier became known, and there is no getting away from the fact that motor cycle manufacturers in pushing sidecarriers after the war will meet with keen competition from this quarter.

Auto-Carriers are to be found all over London and the big provincial cities, and, being engaged on so many different trades, to find one typical example is not easy. However, we consider that the machine illustrated is a good instance of a typical Auto-Carrier. This is an actual show model, having been exhibited at the 1912 Commercial Vehicle Show, and since then it has been in continuous use by its owners, Messrs. Newtons, of Coventry. Its work consists of the rapid delivery of parcels in city and suburbs, and the daily mileage averages about twenty. It has stood up to the work well, and it looks as good as new now. The useful load limit is 6 cwt., and on this point the Auto-Carrier type of vehicle scores over sidecarriers which carry up to 4 cwt.

A typical Auto-Carrier—a make of machine that has been very successful. The one illustrated has seen four years' continual service for Newtons, Ltd., drapers, of Coventry.

A Rex sidecar engaged on war work. It belongs to C. H. Blakeley and Sons, of Sheffield, a quantity of whose Government work is done by outside help. The Rex is used for collecting saws, etc., made by the firm. In the right-hand view the rider is holding up a French band saw used for cutting down the trees in the firing line by hand.

#### A Four-year Old Machine Adapted for Light Munition Work.

THE following experiences of a Sheffield firm show what a machine that has passed its youthful days will do: "A month ago we were dependent on the caprices of an elderly pony in charge of an elderly and 'awkward' old man. We lost touch with our outworkers, and frequently delay of supplies lost us valuable time in the works.

"Now through the medium of a 4 h.p. 1912 Rex with sidecar adapted for our special needs we have been able practically to reorganise the business. A few minutes' run gives us that personal grip with the suppliers of raw material, our sub-contractors, and our customers, of which every business man realises the importance. We are also able promptly to requisition or despatch raw material or finished goods up to 2 cwt. We still need the old pony, but having the sidecarrier enables us to arrange the former's journeys much more economically.

"Being War Office equipment manufacturers, the manufacture of which involves a great number of processes and a variety of fittings, our problem was not only to secure a prompt delivery of supplies, but to keep in touch with

the workers in each process, so that no time was lost in one waiting upon another.

"When the Rex arrived we were absolute novices, but read up our subject furiously in 'Motor Cycles and How to Manage Them.' Our selling friend gave us a trial run and a few hints one evening, and we have learnt the rest by the help of a few blisters and bruised knuckles. We could not say how many times we have attempted to start without turning the petrol tap on, and made the equally silly mistake of leaving the priming cup open. Such things always occur when you are most anxious to impress friends. But actual experience is the quickest way of learning—when pressed for time, if one has an involuntary stop, more is learnt in ten minutes than in a three-guinea course of lessons.

"As regards cost, we cannot give any definite figures, our experience not being sufficiently lengthy. A rough estimate is that the cost works out about half to two-thirds of that of a pony and dray. We know that it is a considerable saving week by week. Besides, the machine is not 'eating its head off' when not in use. Although we desired to economise, our main thought was to get work done, and get it done quickly." W.M.B.

The utility of the motor cycle could not be better exemplified than by these illustrations of motor cycles being conveyed on boarded sidecar chassis. They also bear good testimony to the robustness of the modern machine. Both photographs show outfits used by traders for the conveyance of new models, that on the left being an American Excelsior used by the London agents, Harris and Sons, and that on the right a Douglas used by that firm's London house.

# A CASE OF ECONOMY.

The Running Costs of Motor Cycle, Sidecar, and Car compared.

Cost of Petrol. Train Fare per person.

On 5 gallons of petrol	{	A 2½ h.p. motor bicycle covers 600 miles	}	16/3	{	£	s.	d.
		A 4 h.p. " " " 450 "				2	10	0
		A 6 h.p. sidecar " " 335 "				1	17	6
		A 10 h.p. light car " " 190 "				0	15	10

**E**CONOMY is a word to conjure with. In peacetime it is practised by most sensible people, but in war time the necessity of studying every economy is of paramount importance. A motor cycle is actually cheaper to run than travelling by train; small wonder, then, that the open road is preferred to a stuffy railway carriage. One hundred miles on a gallon of spirit—quite an ordinary performance for a motor cyclist—does not sound as if the petrol scarcity is due to the ravages of motor cyclists! Why, even in peace time some of the larger garages shunned motor cyclist clients because their custom was so small that the garages could not make enough out of them. This was common knowledge, yet motor cyclists are now classed with car owners in the appeals to stop motoring.

As it is clear from statements issued that the War Savings Committee are not cognisant of the cheapness of running a motor cycle, and do not realise that the cost is less than train fares, we have compiled figures from actual results which may assist in their enlightenment. Running expenses, as well as first cost, increase automatically as the size and the weight of a motor vehicle go up.

## Sidecar v. Car.

A motor bicycle and sidecar has always been a more economical vehicle than a motor car, not only in first cost, but also in the cost of running, and in these days of scarce and expensive

petrol the difference is more marked than heretofore. Taking 5,000 miles as a year's running, the petrol consumption on a 6 h.p. sidecar outfit and a 10 h.p. light car may be estimated at about 67 and 38 m.p.g. respectively. This means that the sidecar consumes 75 gallons of petrol while the light car consumes 13½ gallons, a saving of 57 gallons, which at 3s. 3d. per gallon means a saving in the cost of fuel of no less than £9 5s. 3d., the total cost being £12 3s. 9d. in the case of the sidecar outfit and £21 9s. in the case of the light car. A notable difference certainly! A year ago the cost would have been not much more than half.

In the matter of oil and tyres there is not much to choose between the two vehicles; the oil consumption is about the same in each case, and although light car tyres cost more than those commonly used on sidecar outfits they balance that cost by lasting longer.

The other yearly charges, taxation and insurance, are both in favour of the sidecar outfit, the former being £1 for the sidecar and 3 or 4 gns. for the light car, the latter varying with the horse-power and value of the vehicle. Roughly the sidecar insurance may be taken as one-half that of the rival vehicle. The two last-mentioned expenses do not, of course, vary with the mileage, but as yearly payments they must be included in the running costs.

## A Comparison.

Supposing, for example, a sidecar outfit and a light car each started from London for Edinburgh with a petrol supply of five gallons (costing 16s. 3d.), the light car would have to take in a fresh supply

## ECONOMY: WHAT FIVE GALLONS OF PETROL WILL DO.

Four vehicles—a 10 h.p. light car, a 6 h.p. sidecar combination, a 4 h.p. single-cylinder motor bicycle, and a 2½ h.p. lightweight—start from London, each with an allowance of five gallons of petrol. The light car comes to a standstill five miles south of Wetherby (190 miles from the start); the sidecar three miles south of Berwick-on-Tweed (335 miles); the motor bicycle three miles south of Dunkeld (450 miles); and the lightweight four miles north of Tain (600 miles).

## "THE BUTCHER, THE BAKER, THE CANDLESTICK MAKER"—

### EVIDENCE FROM ALL QUARTERS.

**DRY CLEANERS.**—"Have had a sidecar in use for three years with satisfactory results."

**YEAST MANUFACTURERS.**—A Finsbury firm has been using six sidecarriers since the beginning of the war. Results most satisfactory.

**WHOLESALE CONFECTIONER.**—A Sheffield man engaged in this business has a young woman to drive his sidecarrier. Cost of running motor cycle 5s. per week, horse and cart 16s.

**DAIRYMAN.**—From Slough we hear of a single outfit doing the work of two horses and carts. Has done thirty miles per day for the past twelve months.

**CHIMNEY SWEEP.**—An old tricar modernised by a sweep has been very successful. Cost of running, including three new covers, was £21 7s. 2d. in 1915.

**HOUSE DECORATOR.**—A Birmingham decorator uses a sidecarrier exclusively in his work. Averages forty miles per day. Motor does more work at less cost than that of a horse van.

**BILLPOSTERS AND ADVERTISERS.**—A Birmingham firm, with branches elsewhere, has discarded motor vans in favour of three sidecarriers with great success.

**A NEWS-AGENT.**—"I could not get on without my sidecarrier; it is much cheaper than a horse and cart."

Mrs. Browne: "Can you send me a large roast at once? My husband unexpectedly is bringing friends to dinner."

### A Case of Economy.—

before reaching Wetherby, in Yorkshire, or, to be exact, 190 miles from the start, whilst for the same expenditure in fuel the sidecar would get to within a mile or so of Berwick-on-Tweed, or 335 miles from London, the distance to Berwick being 338 miles. To make this example more complete, it may be stated that a lightweight solo motor bicycle with a consumption of 120 m.p.g. would have covered 600 miles on the same petrol allowance and reached a point between Tain and Bonar Bridge, less than 100 miles from John-o'-Groat's, while a 4 h.p. machine at 90 m.p.g. would be in the neighbourhood of Dunkeld.

Baines (the Butcher): "Certainly, madam; you shall have it in ten minutes."

The sidecarrier "eats up" the three miles to Browne's.

### Comfort and Convenience.

On the other side of the picture it must, of course, be admitted that the light car scores enormously in comfort, especially when the weather is wet and cold, and fortunate is the family man who can consider this point instead of the economical side of the question. In spite of its extra size, weight, and comfort, the carrying capacity of the light car is not superior to the family sidecar; in fact, it is questionable whether so many small passengers can be crowded on board without interfering with the free use of the various controls. The verdict, then, on the majority of counts is for the sidecar.

~ And Baines gets a well-deserved advertisement—and three new customers.

## THE NEW PETROL TAX.

A Further Sixpence per Gallon on Petrol. Abandonment of the High Taxes proposed in the Budget.

**W**E imagine that most motor cyclists will be pleased to hear that the proposed motor taxes have been abandoned in favour of an increased tax on petrol. It was, of course, recognised from the beginning that the country needed money and must have it, but the gross unfairness of the first proposals was at once evident to the motor cycling community, and consequently they aroused much opposition.

most use of their machines, and do most damage to the roads. Another point is that those who could not afford to pay a very largely increased tax, and would consequently have had to give up their machines altogether, will now only have to reduce their distances. This, as we have already pointed out, cannot be considered a great hardship.

### How the Tax will be Collected.

The procedure seems to be as follows: Every motor cyclist who has duly filled up his petrol census form will be entitled to purchase a certain amount of petrol during a certain time, and upon payment of the extra duty of 6d. a gallon (we presume upon the proposed monthly supply, but this has not yet been definitely stated) will receive a permit for the amount in question. If the stated number of gallons has not been purchased, the rider will be able to claim the return of a corresponding part of his payment.

On the face of it, it would seem simpler to add the tax to the price of the petrol, as is done at present, but the reason, apparently, is that the new tax is regarded—to quote the words of Mr. Montagu—as

“a supertax on motor cars for the war, and for the war only, and in order to show that it is so we propose to levy it through a body which is going to issue permits under the Defence of the Realm Act.”

Thus we may assume that the present Inland Revenue licences and the tax of 6d. a gallon already on petrol are likely to be permanent, while the new tax will cease with the war.

Doctors, veterinary surgeons, and users of commercial cars will receive an abatement of half the tax, but proposals to extend the same privilege to clergymen, road surveyors, and engineers in the employ of the local authorities did not meet with approval.

The new petrol tax is expected to produce £962,000 for a full year, but this year the yield is estimated at £397,000 less than the £800,000 which it was

### EXAMPLES OF TAXATION ABSURDITIES USED BY “THE MOTOR CYCLE” IN COMBATING THE PROHIBITIVE TAXES SUGGESTED IN THE BUDGET.

6 h.p. solo bicycle .. £4 14 6

8 h.p. light car (twin-cyl., 72 mm. bore), £4 4 0

(From *The Motor Cycle* of April 13th, 1916.)

The new tax may fall heavily on some, but it is at any rate a fair tax, for it will fall most heavily on those who make

### EXAMPLES OF TAXATION ABSURDITIES USED BY “THE MOTOR CYCLE” IN COMBATING THE PROHIBITIVE TAXES SUGGESTED IN THE BUDGET.

2 1/2 h.p. (1910-1916) solo lightweight .. £3 3 0

3 1/2 h.p. sidecar .. £2 2 0

(From *The Motor Cycle* of April 13th, 1916.)

hoped to get under the proposals just abandoned. There was, however, no proof that these taxes would have produced any permanent increase at all.

A smart Sidecarrier is a Travelling Advertisement for its Owners. Machines, such as those shown, attract attention, and so assist in bringing in fresh business.

### EXAMPLES OF USERS WHO RECOGNISE THE PUBLICITY VALUE OF THEIR DELIVERY MACHINES.

Of the above, the most striking, perhaps, is the Lea-Francis sidecarrier belonging to a Nottingham firm of wholesale bottlers of Bass. In the Osram Harley-Davidson good use is made of the back panel. The other two—a Wall and a P. and M.—though less striking, show neatness and smartness in bodywork and the lettering thereon.

# "THE MOTOR CYCLE" RECRUITING SECTION.

## VACANCIES FOR A LIMITED NUMBER OF MEN IN THE M.M.G.S.

This section was instituted with the sole object of assisting readers and directing them to the many different branches of the Army and Navy for which their special knowledge suited them. At the outbreak of war numerous letters reached us (and continue to arrive) from men at home and overseas possessed of motor engineering knowledge, explaining their difficulty in obtaining particulars of Specialised Sections (notably the Motor Sections), recruiting officers being invariably occupied by the demands of the line regiments. The Editor is Inspecting Officer for the M.M.G.S., Heavy Section, Machine Gun Corps, and R.E. Despatch Riders. Throughout, the work has been purely honorary, and no commissions have been accepted. To date, 9,914 readers have taken advantage of our proffered assistance.

**A**FTER a lapse there have been one or two letters from abroad during the last few days from men anxious to join the Motor Machine Gun Service. The training camps of the Heavy Section Machine Gun Corps are, however, full at the moment, so that for the time being applications for enlistment cannot be entertained. This also applies to transfers.

### Fifty Men Wanted for the M.M.G.S.

There are vacancies for fifty recruits in the Motor Machine Gun Service, and applications are invited from motor cyclists able to execute all running repairs, and preferably with sidecar driving experience. The conditions of enlistment in this branch have been detailed on this page on several occasions of late. The rate of pay is 1s. 2½d. per day, all found, the usual separation or dependants' allowance.

Applicants should state age, experience, Group or Class No., when called up, height and chest measurement, and enclose reference as to driving ability. The vacancies are for immediate enlistment only. All communications should be addressed to the Inspecting Officer, Mr. Geoffrey Smith, 19, Hertford Street, Coventry.

### Royal Engineers, Despatch Riders.

More names were added to the different waiting lists of the R.E. Signal Service last week—though a large number of men already being in training, the demand

for men is not pressing. Particulars of enlistment in this section are appended:

AGE.—19 to 38, ex-soldiers up to 45.  
MINIMUM HEIGHT.—5ft. 3in. in socks.  
CHEST MEASUREMENT.—Expanded (bare) 34½in. at least for age 19.  
ENLISTMENT.—As pioneers for duration of war. On joining, recruits will be given the rank of corporal.  
SERVICE.—As Government may think fit, i.e., home or abroad.  
PAY.—2s. 6d. per day, all found, plus 6d. per day engineers' pay after training. Usual separation or dependants' allowance. (Apply to any post office or recruiting office for particulars.)

Recruits must be good, capable motor cyclists, able to perform all reasonable running repairs likely to occur on the road.

All motor cycles are now supplied by the War Office.

A revised list of secretaries of the different R.E. recruiting areas was given in our issue of June 15th (page 561).

### The Technical Corps.

The position with regard to the Technical Corps is still as outlined in our last issue, page 584, recruits being wanted by the Admiralty Yacht Patrol (fitters for the Motor Boat Service), Royal Flying Corps, Army Service Corps, Motor Transport, and the R.E. Wireless Section. Readers who are car drivers or experienced mechanics who may have difficulty in obtaining particulars of the A.S.C., M.T., from their local recruiting officers, should apply to us for the address of the nearest A.S.C. examining officer. A score of readers in different parts of the country applied for this information last week.

### Royal Engineers, Railway Operating Division.

In addition to the vacancies in the Wireless Section of the Royal Engineers, mentioned in our last recruiting page, the War Office advise us of the need for men in the Royal Engineers' Railway Operating Division. Applicants for this section should have a good knowledge of the running and repair of internal combustion engines. The term of military training is reduced to a minimum, as men are required urgently for work at their profession in France. It is said that in this section men attain knowledge which will undoubtedly be most beneficial to them on their return to civil life, whilst the prospects of promotion are exceedingly good. Pay to commence 1s. 2d. per day. After twenty-eight days service and for a further period of thirty-two days this will be increased by 6d. for the ranks below sergeant. The usual separation or dependants' allowance. Applications should be addressed to Quartermaster-Sgt. F. J. Smith, Room 530, War Office, London, S.W.

### A GOOD RECORD.

**T**HE firm of Messrs. C. A. Vandervell and Co., the well-known electrical engineers, has lent many of its principals to the service of their country. Capt. Frank Vandervell has lately joined the Heavy Section Machine Gun Corps, and is now an adjutant; Mr. Percy Vandervell is in the A.S.C. in France with the M.T., A.S.C.; while Mr. Harry Vandervell, who is a stockbroker in civil life, is in command of one of H.M. patrol ships. This is surely a good record for one family. Mr. C. A. Vandervell, the head of the firm, though not in either of the Services, is engaged in the manufacture of important Government supplies.

### ACTIVITY OF LIVERPOOL MOTOR VOLUNTEERS

**M**R. S. W. PHILLPOTT has infused new life into the Motor Cyclists' Section of the Liverpool Heavy Car Battalion of the National Motor Volunteers. The membership roll of the Motor Cyclists' Section has more than tripled during the past six weeks, and Mr. Phillpott has had to appoint an assistant officer, the man selected being Q.M.-Sgt. E. Thomas.

Last week new headquarters were opened at 183, Scotland Road, Liverpool, and on this occasion a sergeant of the Motor Machine Gun Service, who has seen active service, gave a lecture. There are still vacancies for motor cyclists living in Liverpool and district, and all particulars can be obtained from headquarters mentioned above.

A group of Vickers-Clyno machine gun outfits outside one of the garages at the M.M.G.S. training centre.

## NAVAL AND MILITARY NOTES.

MOTOR-CYCLIST-AIRMEN  
DISTINGUISHING THEMSELVES.  
THE GROWING ROLL OF HONOUR.

### AIRMEN MOTOR CYCLISTS.

WE note with interest that Capt. H. Lister Cooper, R.F.C., has been mentioned in despatches. Lister Cooper will be recalled as a leading Triumph rider. Another exponent of this make of machine, also included in the list is Sec.-Lt. G. Boyton, one of the few R.F.C. observers to gain the distinction.

### ANOTHER MOTOR CYCLIST-AIRMAN KILLED.

ALL motor cyclists, and particularly those who knew him personally, will be sorry to hear of the death of John Gibson, who has been accidentally killed. He was originally a despatch rider on the East Coast, and after receiving a commission in the Devon Regiment and undergoing a course of training, was transferred to the Royal Flying Corps.

Gibson was well known in competition circles, having ridden a Triumph, Rudge, and Trump-Jap machines in various events, including the Tourist Trophy. Latterly he drove a Grand Prix Morgan.

Gibson was in turn both amateur and trade man, for though possessed of means inherited from his father, the late George Frederick Gibson, of Newcastle-on-Tyne, he was young, and was interested in garages at Moreton-in-the-Marsh, Stratford-on-Avon, and Torquay. He was one of the best types of sportsman, and was the first to acknowledge a better rider and a better machine. His loss will be keenly felt when competition days return.

Before transferring to the R.F.C., Gibson had a great fancy for the Motor Machine Gun Service, and it seems but a week or two ago that he called at our offices with regard to an application for a transfer to the M.M.G.S.

The unfortunate accident which cost Gibson his life will call to mind the

accident he suffered on the eve of the T.T. race of 1913, when he unluckily collided with a car which backed out of a side road, and for weeks lay in hospital at Douglas in a dangerous condition.

### HONOURS FOR MILITARY MOTOR CYCLISTS.

DESPATCH RIDER C. T. EVANS, formerly with the Rover Co., was mentioned for gallantry in Sir Douglas Haig's recent despatch.

Among the men to receive D.C.M.'s in the latest list is Acting L.-Cpl. O. Dufour Clark, despatch rider in the A.S.C. Dufour Clark, it is officially stated, has done exceptional work, and has never yet failed to deliver his messages, although often the errand necessitated his riding through a heavy fire zone.

### WELL-KNOWN RIDER KILLED.

WE are informed that the relatives of Lt. E. Baxter have been officially advised that he was taken prisoner, badly wounded, during the very gallant bombing attack recorded in these pages a few weeks ago, and died very shortly afterwards. Baxter will be greatly missed, especially in Liverpool motor cycling circles, and his loss adds one more name to the growing list of well-known riders who have given their lives for their country.

### A MOTOR CYCLE WITH A HISTORY.

ON page 494 of our issue of May 25th we reproduced a photograph of an early pattern Douglas that had been picked up out of the sea at Suvla Bay. At the time its earlier history was unknown, but a reader, Cpl. E. E. Smith, has sent us some particulars which throw further light on it. Cpl. Smith first saw the Douglas in question at Leamington in February, 1915, and the second time at Suvla Bay the following September. He had a short chat with its owner, a sergeant of artillery, who told him that it went very well. On the third occasion Smith saw it abandoned by a riding track on the Gallipoli Peninsula. How it got into the sea is still a mystery.

Cpl. Smith, in the same letter, refers to some remarks made by Petty-Officer G. L. Rossiter in *The Motor Cycle* of April 27th, page 395. The latter stated that the motor cycles at Suvla Bay seemed capable of standing anything and the riders capable of taking them any-

where. Cpl. Smith says that it was his section to which this refers, and wishes on its behalf to acknowledge the compliment, and also to place on record his appreciation of the Triumphs which his Signal Company had at Gallipoli.

### SOME IMPRESSIONS AFTER SIXTEEN MONTHS' DESPATCH RIDING.

LETTERS from men on active service, especially from former motor cyclists now acting as military riders, are always interesting, as they are in a position to make comparisons between peace and war time riding. There is, therefore, no excuse to offer for reproducing the following extracts from a letter recently received from L.-Cpl. Clarke, a motor cyclist attached to the A.S.C. in France, and an old trade man who has had sixteen months' army experience:

"We carry on despite weather conditions and worse roads, but that longing for a ride on some of our good homeland highways! I am an old rider, as I started in 1907 as tester to a well-known firm, but never had an opportunity for much competition work. I ride a Triumph out here, and must add my appreciation to those of others, that it is wonderful how well it stands the racket, but sometimes I long for a machine

Sgt. George Bailey, R.E., who has just been awarded the Military Medal. Before the war Bailey was employed by Douglas Bros. in their experimental department.

such as I used to ride when working as mechanic for G. E. Stanley, the 'Wizard' of Singer's. The machines used here could do with a slightly higher gear; 5 to 1 is a trifle too low for a 4 h.p. solo, and there are rare occasions when one strikes a fairly decent road.

"I was exceedingly sorry to hear of Sir R. K. Arbuthnot's death. I had the privilege often of serving him and talking with him when he used to call at the Triumph London depot. If I remember aright, he was an ardent admirer of the 3½ h.p. single."

H. G. Wigzell, assistant secretary to the A.A. and M.U., has just obtained a commission in the A.S.C., M.T.

The late John Gibson, who has been accidentally killed. When the photograph was taken he was a lance-corporal in a Devon regiment; at the time of his death he held a commission in the same regiment.

Sgt. George Bailey, R.E., who has just been awarded the Military Medal. Before the war Bailey was employed by Douglas Bros. in their experimental department.

## TIME TO LIGHT LAMPS

"SUMMER" TIME.

June 29th	...	...	9.49 p.m.
July 1st	...	...	9.48 "
" 3rd	...	...	9.48 "
" 5th	...	...	9.47 "

### Premature Payments.

It is said that some motorists have already paid the proposed increased tax on motor cycles and cars, now withdrawn in favour of a further petrol duty of 6d. per gallon. All such should at once make written application to the particular Council concerned for the return of the amount overpaid.

### Pleasure Motoring.

A member of our staff visiting the West of England during last week-end noticed that regular daily pleasure trips, per motor char-à-banc, are still in full swing in that part of the country, and are apparently well patronised. In particular two of these were seen returning from a long day's run, and the passengers had been dining, not wisely but too well, as evidenced by their rowdy behaviour, singing, and shouting. And still the harmless motor cyclist, whether on business or needful recreation bent, has to beg for petrol, and his demands are received as though it were a criminal act to use the spirit at all.

## SPECIAL FEATURES

THE CULT OF THE SIDECARRIER: Experiences of Users, and Many Illustrations.  
THE ECONOMY OF THE MOTOR CYCLE.

### The M.M.G.S. Annual Sports.

On Friday afternoon last there were held at Bisley Camp, the Motor Machine Gun training centre, the annual sports of the Corps. It was hoped that some motor cycle events would have figured in the programme, but after due consideration by the committee this was unfortunately found to be impossible. Throughout the afternoon the weather was threatening, but, fortunately, not bad enough to interfere with the sports. During the afternoon the excellent band of the 12th Reserve Cavalry Regt. played, by permission of Lt.-Col. R. G. Brooke, D.S.O.

### Out of Evil cometh Good.

To an extent not generally appreciated, the British motor cyclist has in the past supported German industries in following his pastime, generally not a few of his accessories and nearly always his magneto hailing from the hideous Hun-land. And this is not the worst, since in practically every country of the globe it is the British motor cycle that is most esteemed and in greatest demand, the consequence being that our own manufacturers have been instrumental in creating a wide market for such German-made goods. There is this much to be hoped for in the future, however, that, if the recommendations of the Paris Conference are acted upon as they should be, we have seen the last of such an odious state of affairs. British magneto manufacturers, please note.

### More Petrol Waste.

During the past few months many instances have been quoted of wastage of petrol in the Services. We have just been told, though we can hardly credit it, that brick floors at a certain aerodrome are swilled with petrol, just as if it were water, and then swept with yard brooms!

Pastor John Swordson, of Karis, Finland, who uses his L.M.C. motor cycle for travelling in remote parts of Finland on his preaching tours.

### The Petrol Tax.

Another jump in petrol can be expected at any moment as a result of the decision to impose a tax of 6d. per gallon on petrol consumed, in lieu of the heavy taxes originally proposed. The new scheme is referred to on another page, as also the part of *The Motor Cycle* in changing the unfair proposals originally made.

### Thornton Heath Wounded Soldiers' Outing.

The wounded soldiers' outing referred to on page 586 of the issue of the 22nd inst. will be held, all being well, on Wednesday afternoon, July 5th, starting from the Clock, close to Thornton Heath Station, at 2 p.m. The journey will be made to Leith Hill, where tea will be served. Offers of assistance have been received from several drivers of sidecars, and the organiser, Mr. Alfred Taylor, has promised to bring a certain number of friends. All owners of sidecars who intend to assist, and have not already informed Mr. Taylor, should write him, c/o the Editor, *The Motor Cycle*, 20, Tudor Street, E.C.

### POPULARITY OF SIDECAR RUNS FOR WOUNDED SOLDIERS.

Convalescent soldiers in sidecars on the road to Staines from Harrow on Saturday last.

**Death of a Speedometer Manufacturer.**

The death is announced from New York of John K. Stewart, inventor of the Stewart speedometer and head of the manufacturing firm.

**Police and Swivelling Lamps.**

Two Coventry motor cyclists travelling between Bedford and Northampton last week-end were stopped by a constable in uniform, who was assisted by a special constable, ostensibly to examine the driving licences. After copying the details from these, the remark was passed, "Are your machines in order?" which caused a certain amount of consternation to the riders, but the police officials proceeded to test the lamps. One was found to be of the swivel-

ling variety, though the other rider had taken the precaution to braze the attachment, as we have recommended on so many occasions in the past. The lamp of the offending motor cyclist was confiscated, and as it was 8.20 p.m. and the motor cyclists were some forty miles from home, it proved rather awkward. No entreaties succeeded in obtaining the return of the lamp, as it was pointed out that this would mean repeating the offence. Apparently the fact that the motorist had forty miles to go with no lamp and was obliged to exceed the speed limit did not occur to the police officials. We had perhaps better not say whether the motor cyclist got home or not before dark, seeing that the police in question still retain the lamp and generator, and might add another charge.

THE MODERN CHIMNEY SWEEP FINDS THAT HE CAN ACCOMPLISH MUCH MORE WORK WITH A MOTOR CYCLE THAN WITH A HANDCART, AND THE INCREASED BUSINESS SOON MORE THAN REPAYS THE COST OF THE SIDECARRIER.

The left centre picture is of a ten-years-old Riley tricar converted for a sweep's use. It is still running well. The Bath sweep shown in the right centre takes off the special cover for the sidecar for pleasure runs at week ends.

**Price of Petrol.**

According to Pratt's circular issued on Saturday last, petrol remains at the same prices as it did before the new taxes were announced last week. But the question is, can one obtain petrol at the old figures?

**Outing for Wounded Sailors.**

It is proposed to hold another outing, this time for wounded sailors, on Saturday, July 8th. The trip will be to Lord Northcliffe's seat, Sutton Place, Guildford. Sidecarists who are willing to take part are requested to communicate with Mr. J. A. Masters, c/o Harley-Davidson Motor Co., Ltd., 74, Newman Street, W.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund (£3,318,000 distributed)	£5,909,097	0	0
Fund for the Sick and Wounded	3,938,393	0	0
The Queen's Work for Women Fund	169,592	16	4

**Running Costs of Sidecarriers.**

In compiling this special number of *The Motor Cycle* we have been struck with the fact that few users of sidecarriers appear to keep careful and full account of the running expenses of the machines. This applies in particular to the small tradesman, who probably only has one or, at the utmost, two machines. But whether it is one or a dozen, the desirability of keeping a careful record of the working costs cannot be over-emphasised. It is the only way to see that the very best results are being obtained from the vehicles.

**A Strenuous Run in New Zealand.**

A remarkable sidecar run has recently been accomplished in New Zealand. E. F. C. Hinds drove a Powerplus Indian sidecar the whole length of the South Island, a distance of 648 miles, in 31½h. The average speed of 20½ m.p.h. on paper may seem very ordinary, but when the appalling roads and bad weather are taken into account one wonders how such a good speed was possible. At one place in the early hours of the morning Hinds and his passenger had to wait nearly two hours for petrol, and in several districts the roads were so bad that mile after mile had to be covered on bottom gear. The starting point was Picton, at the north of the South Island, and the finishing point The Bluff, at the southern end.

**Harrow Wounded Soldiers' Outing.**

Quite a successful sidecar outing for wounded soldiers was carried out by a few enthusiastic motor cyclists of Harrow last Sunday, June 25th. Permission to take part had been given by the Commandant of the Holmleigh Hospital, Mr. C. J. S. Thompson, to about twenty of the most convalescent of the invalids.

A start was made from the hospital at 2 p.m. sharp, and the route taken was through Pinner, Ruislip, Uxbridge, and Staines, a distance of twenty-three miles. At Ickenham the Rex combination had tyre trouble, but everyone reached the Bridge House Hotel by 3.30.

The guests were then taken for a river trip on a motor boat kindly lent by Mr. Sweeting. After a pleasant hour spent in this way, they returned to the hotel, where tea was provided for them by Messrs. Simpson and Long.

## Average Prices OF Second-hand Machines.

From "The Motor Cycle" of June 22nd.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within four weeks.

Make.	Year.	H.P.	Average for last week.	Latest average obtainable

### WELL-KNOWN RIDER MARRIED.

George Brough and his bride, Miss Evans of Bulwell, photographed after the ceremony at Nottingham on Monday last. The wedding was to have taken place last month, but had to be postponed owing to illness of the bridegroom.

## PETROL LICENCES.

### Penalty for Breach of New Regulations.

THE parliamentary correspondent of *The Times* writes: The new Government scheme for the control of petrol stocks is explained in a new clause to the Finance Bill which Mr. McKenna has just put down. All consumers, except doctors, veterinary surgeons, and users of commercial cars, will in future only be able to obtain petrol under a system of permits at a special duty of 6d. a gallon above the existing rates. The following conditions are attached:

1. A person shall not obtain or attempt to obtain a supply of motor spirit unless he is the holder of a licence for the time being in force under this section, or in excess of the amount with which he is authorised to be supplied by the licence.

2. A person shall not supply motor spirit to a person unless he is the holder of a licence for the time being in force under this section, or in excess of the amount authorised to be supplied by the licence.

3. A person supplying motor spirit shall, in such manner as may be directed by regulations made under this section, enter on the licence of the person supplied the name and address of the supplier, the amount supplied, and the date on which it was supplied.

4. A person shall not use motor spirit with which he is authorised to be supplied for any special purpose by his licence for any other purpose.

5. If any person acts in contravention of or fails to comply with any provision of this section or makes any entry on a licence which is false in any material particular, he shall be liable to an Excise penalty of £100.

### MOTOR CYCLISTS AND LIGHT CARS.

Those readers of *The Motor Cycle* who have latterly turned to small cars, or who may own both types of vehicles, will be interested in *The Light Car*, published each Wednesday in a buff cover. *The Light Car* deals with small cars of all types, and is, in brief, the journal of economical motoring. An article in yesterday's issue (now on sale), which should particularly appeal to motor cyclists, is a lady's account of her experiences with a Grand Prix Morgan. Miss Nora Hough, the writer, who hails from Birmingham, is known to many readers as a leading motor cyclist, so that the suggestions made, including one of detachable wheels for the Morgan, are from practical road experience.

After you have read this issue of "The Motor Cycle," hand it to a tradesman acquaintance—he is sure to be interested.

## AN IRISH COMPETITION.

### ALL DAY RELIABILITY TRIAL IN COUNTY WICKLOW.

SCENES IN LAST WEEK'S IRISH TWENTY-FOUR HOURS' TRIAL.

(Left) D. Lucy (2½ h.p. Douglas) rounding the hairpin bend leading from Wicklow Gap to the Seven Churches. (Right) Two B.S.A. riders, F. L. Dooley and C. S. Kettle, crossing the Dargle Bridge at the foot of the ascent of the observed hill at Annacrevy.

THE all day reliability trial of the Dublin and District Motor Cycle Club, which started from Dublin on Friday evening, at eight o'clock, came to a conclusion at 7 p.m. on Saturday, when nineteen of the twenty-five starters checked in at the final control at Rathfarnham. Difficulties of securing petrol at one time looked like compelling the committee to abandon the event, as so many other competitions in Ireland have had to be abandoned during the year, and they ultimately resulted in the time honoured route to Donegal and back, with the ascent of Glengesh as the crucial part of the trial, being abandoned in favour of a course more adjacent to Dublin.

#### Petrol Supplies.

Even this alteration did not end the troubles of the promoters, as it was found necessary to make private arrangements for the supply of petrol, and for this purpose the services of a motor car were secured to carry the fuel from point to point. The arrangement worked out quite satisfactorily, and at no point had any of the competitors to retire owing to want of fuel.

The competition started from Rathfarnham, the men being sent away at one minute intervals.

The first part of the route took the riders through Glendhu and over the Sugarloaf mountain, this being part of the military road. Once over the Featherbed, the men descended to Glencree, and from there ascended to the source of the River Liffey and the highest point of the military road at Sally Gap. Then they went westward to the main Dublin-Blessington road, and completed the first section of the route by an easy run to Carlow.

It was somewhat of a misnomer to call the event a twenty-four hours trial, as, apart from the necessary stoppages for

food and refreshment, there was a stop of nearly five hours at Carlow, and also the event finished an hour earlier than it started. The five hours at Carlow gave an opportunity of getting a little sleep, of which, however, few availed themselves, and also robbed the competition of the terrors of night riding—always a dangerous game on Irish roads, which are often selected by donkeys as their sleeping places. Hurse's retirement was due to a broken inlet valve, and Morrogh's to overheating.

The morning journey commenced with a run towards Dublin as far as the outskirts of the city. The men then returned to Naas, where the lowlands were left behind, and the Co. Wicklow crossed in an easterly direction. The route lay through Ballymore-Eustace, Hollywood, across Wicklow Gap to Glendalough, where two hours were allowed for a second breakfast. Afterwards the trial was resumed by rejoining the military road at Laragh, and following it over the mountains to Drumgoff and the Vale of Glenmalur, and again over a mountain range to Aughavanagh. Here the riders turned eastwards down the valley of the Aughrim to Woodenbridge, and passing through the Vale

of Avoca, with a tantalising glimpse of the Meeting of the Waters, they proceeded towards Rathdrum. The early morning journey from Carlow saw four men retire—Allen (Sun), with a broken oiler; Mayne (Indian), with a broken chain; Sullivan (Indian), with timing and carburettor troubles, following a fall; and Fitzpatrick (Indian), with tyre troubles.

#### Steep Non-stop Sections.

The final stage of the trial was by no means the least severe. It involved the ascent of the Wicklow mountains to Sally Gap.

The route then ran towards Dublin, returning southwards to take in the two observed hills—Goat Pass, near Enniskerry, and Annacrevy Hill, from the Dargle.

After the second observed hill the men returned to near Roundwood, and made a second ascent of Sally Gap by Luggelaw, returning to Dublin by the military road.

#### List of the Survivors.

The first of the men was due at Rathfarnham at seven o'clock, and punctually to time Freeman, the cup-holder, turned up on his Indian. The nineteen who survived the night and early morning journeys finished to time. They were:

- W. H. Freeman (7 Indian)
- A. W. Mooney (7 American Excelsior sc.)
- J. Stewart, Belfast (2½ Douglas)
- Corpl. J. Griffiths (2½ Douglas)
- P. Grimes (7 Indian sc.)
- D. Lucy, Cork (2½ Douglas)
- W. J. Henderson (7-9 Harley-Davidson sc.)
- F. McDonagh (4½ B.S.A.)
- F. Cunningham (7 Indian sc.)
- F. L. Dooley, Cork (4½ B.S.A.)
- A. Carlon (7 Indian sc.)
- C. S. Kettle (4½ B.S.A.)
- S. A. Allen (5 Enfield)
- T. Woods (4½ B.S.A.)
- O. S. Redmond (3½ Indian)
- T. J. Dunphy (5 Enfield)
- C. B. Franklin (2½ Indian 2-stroke)
- T. Toole (4½ B.S.A.)
- R. Walsh (4½ B.S.A.)

#### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD.

## LETTERS TO

## THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Fast Stretches.

Sir,—I notice that your contributor "Ixion" refers to "fast stretches." Personally, I have not been "on the road" for nearly two years, and have forgotten most of the fast bits. But a portion of the Andover-Salisbury road is not so slow, but is undulating. Then there is the road from Devizes to, I believe, Beckhampton, on the Bath Road. Cambridge to Newmarket is as fast a road as I can remember, there being only two corners that one cannot get round at 60 m.p.h. on a car. Does "Ixion" know the Northampton-Oxford Road—a really sporting forty miles blind? B.A.T.

#### Bearing Pressures in Long-stroke Engines.

Sir,—I heard a gentleman the other day jocularly remark, "Whatcher wantin' 'it me like that for? I ain't done you no 'arm," and when an hour afterwards I read "Ixion's" remarks re long-stroke engines and novices it at once occurred to me that the long-stroke engine, could it speak, might aptly make the same remark. I imagine careless handling of the long or short-stroke engine is bad for the bushes of either type, but it must be remembered, when making comparisons, that the maximum pressure on the connecting rod bearings of the short-stroke engine of given capacity is much greater than that on the long-stroke bearings; also that friction primarily depends upon pressure and wear upon friction. This being so, and, other things being equal, short-stroke engine bushes must necessarily have the shorter life.

JAS. L. NORTON.

#### A Farmer's Experience of a Sidecar Outfit.

Sir,—In April, 1914, I purchased a Sun with 4½ h.p. single-cylinder Precision engine, Sturmer-Archer three-speed hub gear, Dunlop tyres and belt. To this I attached a second-hand wicker sidecar, and the outfit has done the work of a pony and trap, such as fetching goods from the station (two and a half miles), and conveying dairy produce, etc., to market. Recently I took a carcase of pork (120 lb.) to the

pork butcher in a town four miles away, over a hilly road, and I have frequently taken loads of from 2 cwt. to 3 cwt. beside myself (150 lb.) The mileage is just over 5,000. I have always completed my journeys to time. The engine valves have never been ground in, and compression is still satisfactory. I have decarbonised once—sixteen months ago. The hub gear has given perfect service, and I might say, for the benefit of users of hub gears, that I always slightly declutch, as well as give the exhaust litter a pull when changing gear.

At present I am using a .50 jet in the Amac carburetter, and the consumption of petrol is somewhere in the vicinity of 70 m.p.g. The engine takes our stiff Cornish hills with full load without a murmur, including the Gunnislake terror. I feel sure that if an ordinary farmer like myself can make the sidecar a profitable investment, its possibilities for the use of butchers, grocers, etc., must be unlimited. I use my outfit but very little for pleasure, as I have to work seven days per week in these critical times; but a business drive on a thoroughly reliable machine is a real treat and a pleasure in itself.

SATISFIED.

#### British Export Trade in Motor Cycles.

Sir,—I take this opportunity of assuring you that your efforts to obtain greater facilities for exporting motor cycles are much appreciated by our friends abroad. A Danish friend of mine, writing from Copenhagen, says, "I certainly intend to follow your advice and invest in a motor cycle, but I fear it will be some considerable time before I can get a suitable mount. I would never dream of getting anything but a British-made motor cycle, but the importers inform me that they cannot hope to fulfil present orders until far into the autumn. Money is plentiful in this country, and the American agents are reaping a rich harvest."

It seems a great pity that our makers should not be permitted to benefit by this unique opportunity of increasing their markets, but it is to be hoped that your efforts may meet with success.

JULIUS SALVESEN.

SIDECARRIERS IN A BILL-POSTING BUSINESS.

3½ h.p. Ixion, 4½ h.p. B.S.A., and 5 h.p. Rex, used by Sheffield's, Ltd., advertising contractors, of Birmingham, in their bill-posting business. Motor vans were used formerly, but the sidecarriers have proved more successful, and it is probable that the firm's branches in other towns will follow suit.

### The Petrol Tax.

Sir,—I take it that the change in the motor tax will apply in the same respect to motor cycles, and I consider that we all are greatly indebted to you for the great efforts you have made all along the line to try and bring this about. Although we felt sure that the new tax if put into force would have soon defeated its own ends, still it is something in times like these to see the Government advised in time.

The week-end and small consumer now get a chance for a health run, and should be content with doing a shorter distance and a longer look at the country.

E. HAWTHORN.

Sir,—The other day the Chancellor of the Exchequer stated that the duty on petrol is to be raised to 1s. per gallon. What is the trade going to do? Are the manufacturers going to raise no protest? It is no use arguing about war prices and war costs. When the war is over, and the manufacturers have to pick up their trade again, the users of motor cars and bicycles will have found some line different from "expensive motoring" to fill up their time. It will be a melancholy experience walking through a large motor works after the war when no shells are on the lathes and the busy wheels are still.

Why this unreasonable crusade against motorists? What have we done?

THOS. ABLE.

### Distribution of Weight in Sidecars.

Sir,—I read with interest in your issue of June 22nd a letter from Mr. H. St. V. Addenbrooke, in which he denounces in unmeasured terms the distribution on the chassis of the weight of the sidecar body as delivered by the manufacturer. He asserts that the body should be so suspended that the centre of weight when loaded should be directly over the back axle, which naturally puts all the pressure on the two back wheels, and none on the front wheel and forks.

I admit the same idea occurred to me as a sidecar novice, and I altered the body accordingly, but immediately found, among other things, that the outfit was so subject to front wheel slip or skidding as to make it absolutely dangerous when cornering at speed. Since then I have made careful

practical experiments, alike as to the position of sidecar, stability of outfit under all conditions, and the difference which such position had on the power absorbed.

After these experiments, now some four years ago, I adjusted the outfit as follows: Line of sidecar axle, 4in. in front of back axle of machine; front of seat, 14in. in front of sidecar axle; centre of hub of sidecar wheel, 38in. from centre of hub of driving wheel. It has not since been altered, and gives perfect running. I have never had a trace of skidding; the outfit will run any reasonable distance hands off, as will also the machine solo, so that the effect of the side strain of which Mr. Addenbrooke speaks could have had very little effect on the trueness of the machine.

On the other hand, even with the weight distributed over the three wheels in this way I have broken the back bottom stay on which the sidecar chassis is fixed. With regard to the other point as to back wheel slip when hill-climbing and the practice of leaning or sitting on the carrier, this is not done altogether to prevent spin or slip, as Mr. Addenbrooke infers. Supposing there is absolutely no slip, a  $3\frac{1}{2}$  h.p. outfit will climb much better with the weight on the carrier instead of in the sidecar, especially when the hill has a slight bend to the right. This, I take it, is due, not to the transference of the whole of the weight, as he says, on the back axle, but to the centre of the driving wheel, which obviates a certain drag by the sidecar wheel when turning to the right or when meeting any obstacle or hole in the road.

For this reason I found that the nearer the sidecar was to the machine the better it climbed; this, of course, is again governed by the stability necessary.

A. J. SHEPPARD.

### Naphtha as a Fuel.

Sir,—In last week's issue of your journal is a letter from H. W. Kilbey referring to some experiments he has been conducting with naphtha as a substitute for petrol.

The point of unsuitability which he raises, viz., that the acid which is produced on combustion reacts on the cylinder, has been answered by the inventors of "Natalite." This is an alcoholic fuel which, the inventors state, has no deteriorating action on the cylinder.

MOTOR CYCLIST.

CONVALESCENT SOLDIERS ENJOYING THE DELIGHTS OF THE OPEN ROAD IN SUMMER TIME.

The photograph was taken on the occasion of the sidecar outing on Saturday last organised for the wounded at Harrow, the destination being the Bridge-House, Staines.

#### Four-cylinder Engines.

Sir.—Mr. Freeman Lee's somewhat sarcastic reference to "a complete treatise on tuning" a four-cylinder F.N. in relation to my remarks on the subject probably arises from ignorance of the fact that recent letters of mine in this connection have brought me a host of postal enquiries from F.N. riders not possessed of his mechanical ingenuity; and, since the object of *The Motor Cycle* is to be of interest to the majority and not the minority of motor cyclists, I endeavoured in my letter to reply in as limited a space as possible to the mass of correspondents who are apparently essentially concerned with getting the best out of the standard machine without attempting radical alterations.

To avoid a detailed description of alterations, which could only be of interest to a few, I may say that if Mr. Lee cares to communicate with me through the Editor, I am prepared to lend him the patterns of a device similar to his own for the mechanical operation of the F.N. inlet valves, the difference being that my arrangement will work fairly satisfactorily, whereas his arrangement, as illustrated in *The Motor Cycle*, is practically identical with Mr. Stewart's original design, which he discarded as impracticable some years ago.

A little well-meant criticism of Mr. Lee's design may prevent enthusiasts wasting time and money for a speculative benefit. The sketch seems to show a manifold all in one piece through which is run a shaft with the cams superimposed. This is scarcely practicable, and would be a troublesome job. His cams should be recessed in the shaft, so that the latter will pull straight through the bearings.

Again, cams operating directly on the valve stems, as per sketch, would rock the valves on the seatings, causing chattering, and, at high speeds, fracture of the valve stem. Spring slippers or rockers should be interposed, and here I would emphasise that the spring slipper used in my design not only causes the valve to open evenly, but also acts as a mechanical "closer," so that chattering, which is the bugbear of the F.N., cannot occur. No provision for lubricating the cams is shown, and when Mr. Lee remembers that they are subject to a continuous current of oil-removing petrol vapour, he will see that this item is a problem in itself. Since the shaft H must be rigid, and the cams are not adjustable, and since the manifold must make a gastight joint with the cylinders, it is essential that the method of manifold attachment must admit of adjustment. In practice, this is usually provided at the two middle joints. Mr. Lee appears to have overlooked this point. Shaft H made as shown in the sketch would cause misfiring in cylinders 1 and

4, owing to dilution of mixture. I found that this shaft required to run in long bearings, to be capped at the driven end, and to be provided with a stuffing gland at the other end. In fact, a special rectangular manifold with a side induction pipe is essential to satisfactory running. The chain drive to shaft H will never be entirely satisfactory. A skew gear is the proper thing, and in support of this statement I would direct attention to chain-driven cam gears in car practice, where silent chains with short centres and provision for adjustment are invariably employed. I do not think I need elaborate my criticism, as I assume Mr. Lee's sketch to be a rough diagrammatic exposition of an idea that is full of interesting suggestion, and it would ill become me to deter other amateurs from making public ingenious ideas by criticising in detail a rough drawing, the root principle of which might easily be worked up successfully by an enterprising manufacturer.

The letter on the same subject by "L.M." is altogether commendable. His double lever carburetter control is, however, not original, and has been extensively used in the North for some years, the idea having originated, I think, with Mr. Leigh Scanes, of the British Westinghouse Co. Moreover, "L.M.'s" censure of the F.N. Co. is not justified, as they have fitted their car carburetter with his idea for some years, the method of operation being by means of an outside lever to which can be attached a Bowden wire. It is a peculiar fact that, although the carburetter is so fitted, the makers do not utilise the fitment, preferring to join both controls to a single rod, thus leaving it to the expert owner to employ separate controls if so inclined. Presumably they, in "Ixion's" words, shared Carlyle's views as to the proportion of fools in the population. "L.M." should also remember that the F.N. automatic carburetter is expressly designed for the F.N. standard automatic valves. At low speeds these valves will scarcely open, and an ultra rich mixture is required to ensure a fair amount of gas entering the cylinders. Mechanical valves alter the conditions, and "L.M." will find that on the 7-9 h.p. F.N. with mechanical valves quite a different type of carburetter is fitted. Automaticity and complete efficiency in carburation do not go hand in hand, and the F.N. Co. have, I think, wisely preferred the simple and sufficiently efficient alternative.

One frequently reads in the motoring papers of hankerings after the rotary aero engine in the motor cycle frame, and "L.M." renews the appeal. Might I suggest that a little contemplative study of the antics of a child's top spinning is helpful in forming an estimate of the gyroscopic action of such an engine in a motor cycle frame when cornering at speed.

H. E. THOMPSON.

EXAMPLES OF THE BUSINESS USE OF THE SIDECAR IN THE UNITED STATES.

The mail carrier is an Indian outfit in use at Norfolk, Va., the U.S.A. postal authorities using many of these machines for parcel and rural deliveries. The other photograph shows an ordinary sidecar outfit of the same make used by an electric lamp mechanic of Hutchinson, Kan.

## Where the Motor Cycle Wins — Fighting Time.

### THE GREAT ADVANTAGE OF THE TWO-WHEELER FOR A PRESSMAN.

In this search for quick transit the motor cycle has been tried, and as the following article shows, with great success. An important point is that not only has the motor cycle proved to be the quickest means of "delivering the goods," but also the cheapest.

In order to show the working of the motor cycle under various conditions of press work, we present herewith short articles from three men each working in different towns and in different classes of work. These are:

(1.) A free lance London journalist who uses his machine for both the collection of news and photographs.

(2.) A photographer attached to a firm publishing morning, evening, and weekly newspapers in Liverpool.

(3.) A press and commercial photographer operating from Birmingham.

**T**HE very essence of a daily pressman's life consists of a continual race against time. Competition is so keen that every device that can be thought of is employed in the collection of news and photographs in order to beat "the other fellow," and if "the game is worth the candle" no expense is spared in getting the desired copy and negatives to headquarters.

As a result of growing competition, pressmen—both those on the staffs of various papers and free lance men—have tried every conceivable means of transport in an endeavour to go one better than competitors.

### I. IN THE WORK OF A LONDON FREE LANCE JOURNALIST.

**I**T does not follow that because a man is getting pleasure out of motor cycling that he must needs be "motoring for pleasure," but the delight of it, the joy of the open road, may come as a corollary to utilitarian work such as that of a commercial traveller. Mine is a case in point. I am one of those journalists who earn a precarious existence by what is known as "free lancing." That is to say, I owe allegiance to no particular journal, nor are my pockets well lined regularly every Friday or every month, as the case may be.

#### Competition with Staff Men.

Now the free lance has to compete with staff men, and in order to do this successfully he must be just a little better in one way or another; otherwise his "copy" would come second to that of the salaried man, and obviously papers are not out to pay their own men a weekly stipend and use an outsider's report or pictures. All other things being equal, everything depends on speed, and this is more the case with pictures, where agencies vie with each other in getting their photographs into the art editor's before any of the opposition. That is where the motor cycle comes

in. It enables its lucky rider to go one better than his colleagues who have to rely on public service vehicles. I think I can claim to have initiated the idea of running a machine all the year round as a means of transit in connection with the lay press, and I might here say that the enterprise has been well required.

#### Some of the Advantages.

Psychology plays a very important part in the success of the motor cycle as a journalist's hack, for a man will sometimes cover a doubtful "story" by road where he would not by train, because he knows that at the worst he will have had an enjoyable outing without profit, and when he comes back he is too delighted with the ride to trouble about the failure of the specific reason for it. But the man who unsuccessfully stalks a story by train has time to brood

over his bad luck. It has happened that I have been at the office without my machine, and because of this have not troubled to go on a speculative trip, because the chance of getting something was not worth the expense and inconvenience attaching to the job. It has also occurred that, because I had my machine I

L. H. Cade, a London journalist, who uses a 1915 Triumph in his work.

**Where the Motor Cycle Wins—Fighting Time.—**

have been on stories with only a small chance of getting anything with a market value, and it has turned up trumps.

The motor cycle, then, is a direct incentive to speculative business, which, taken all round, is the most profitable. It is also an extremely healthy means of transit, and is cheaper than any other practicable way of touring for business. The motor cycle enables a man to get back to town so much quicker, too, that he can get his matter or pictures out almost leisurely and yet be sure of getting into the editor's sanctum first. I remember once beating about a dozen photographers by nearly two hours on a story which happened in an obscure Kentish village, and the result was that I, at the least expense, secured all the proceeds.

There was another time when an incident which lent itself to interesting photographs gained currency in the press. It concerned a Marquis who was serving as a special constable in a Berkshire village, and, since the day was pleasant, I got across my Triumph with camera case slung over my back. Well, I found the

Marquis, secured some interesting snapshots, and did very good business out of it. But if I had not had a motor cycle I should never have gone on the job.

For about three years I have ridden up to London from my Croydon residence practically every morning, and have used the two machines which have served me—both Triumphs—on all roads and under all conditions. Never once have I been delayed; never have I been beaten by a train travelling colleague. Small wonder, then, that I regard my dear old bicycle as an essential "tool of trade."

And now there is threatened a total prohibition or serious curtailment of pleasure riding, and I fear me that the authorities will not lend a sympathetic ear to such cases as mine. Truly I do not use a commercial sidecarrier, but nobody ever used a machine more genuinely for business purposes than I do. It pays me handsomely, despite the present price of petrol and the increased cost of upkeep generally, and it pays the nation because I contribute much more to the Exchequer by using the machine than I should if I refrained from doing so.

L. H. CADE.

## II. TELLING CASES OF THE ADVANTAGES OF THE MOTOR CYCLE FOR A STAFF PHOTOGRAPHER.

**T**AKE the sudden emergency case. One morning there was a sudden murmur round the office, "Big railway smash." I rush into the editor's office and there learn that it is in a corner of Yorkshire difficult to get at by railway, and ninety miles away. I sling my camera case on back, run across to the garage, fill up with spirit, and away. How that Zenith did go. The run to Lancaster (52 miles from Liverpool) was well in front of best train time, and the scene of the smash was reached over three hours before our reporters, who did their best by train and bicycle. Now these three hours were more important to me than to the reporters. I got snaps while the wreckage was being rapidly removed. Three hours later so much had been cleared that the photographs taken then had nothing like so good a news value as those I secured earlier. A quiet return home, and next morning the *Daily Post* was the only Liverpool morning paper to publish illustrations of the disaster.

### Beating Trains, Trams, and Taxis.

Now take a case where the time and place are all known beforehand, as the funeral of young Squire Gladstone at Hawarden. This was timed for 3 p.m. In the morning I rode over, after leaving instructions at the office to have all ready for a last minute rush. At Hawarden I found a dozen pressmen, all talking over the quickest route back. My chief competitor had fixed on a fast car to Chester, then express to Rock Ferry, and then electric underground railway to Liverpool, a fast route. This would take a lot of beating, but would be a very close thing for catching the last edition.

I placed my motor cycle just clear of where the crowd would stand, on the road to Queensferry. The funeral appeared, and at 3.15 p.m. we all got the snaps we had waited for, and then went our different

ways. I jumped on the machine and let it go down the hill; as everybody was at the funeral the road was quite clear, and travelling at over a mile a minute I swooped down to the ferry. I had warned the toll-keeper when crossing in the morning, and he had the bridge gate held open. The Zenith took that bridge in a few bounds, and the sixteen miles to Birkenhead landing stage were covered in very good time. Crossing the Mersey on the ferry boat, I was soon mounted again and reached the offices. I went up to the dark room three steps at a time. The plate was developed, fixed, and an enlarged print given to the Editor of the *Echo* at exactly 4 p.m., just forty-five minutes after taking

the snap; it appeared in the last edition. My friend the enemy failed by ten minutes, in spite of a fast run to Chester and just catching the express, etc. Result, we were the only paper to publish that photograph on the day it was taken. So the motor bicycle enabled us to come out with the illustration a full day before any other firm, even when, as in this case, expense was not spared, and the motor cycle proved the cheapest of all.

Now for an example of the usefulness of a sidecar outfit. One year the rivalry between the *Daily Mirror* and the *Daily Sketch* was very keen, and at the Waterloo Cup both papers sent their best men. On the last day the photograph to obtain is that, taken after the finish, of the winning dog with the blue ribbon round its neck, and held by the owner. This is

A good combination of man and machine that has made some splendid press photography "scoops"—J. Edge and his Zenith.

**Where the Motor Cycle Wins—Fighting Time.—**

usually obtainable just after 1 p.m. The only train to London from Liverpool to reach the capital in time for the following morning papers leaves Lime Street Station at 2 p.m., and the distance by road from Altcar to Liverpool is over eleven miles, the first part on narrow country lanes, and then miles of traffic and tram lines into town.

The weather was wild that February. The *Mirror* men had arranged to motor to Formby (four miles away), catch the electric train from Southport to Liverpool Exchange, and taxi from Exchange Station to Lime Street. The *Sketch* man (a chum of mine) depended on a car to run the eleven miles direct. As time went on we looked like being later than usual. The *Sketch* man asked me if I could beat the car in the run to town. I was sure I could. So he exchanged with my passenger, who was not in any hurry, and, after we had obtained our snap, we made a dash for it. It was a thrilling ride, passing the cars and taxis that had started before us on the narrow roads, where another car could not have passed at all; then the traffic dodging in town. We caught the London train by three minutes, and saw it off with the plates on board; then gleefully watched the arrival of the other boys, from five to fifteen minutes late. The *Sketch* was the only London paper to have the much sought after photograph the following morning.

**III. A MIDLAND PRESS AND COMMERCIAL PHOTOGRAPHER.**

**M**ANY people think that press photography is the only kind that requires a rush, not realising that the secret of private work is to let the persons concerned see the finished picture the same day, if possible. While the happening is fresh in their memory they are keen, and will promptly order photographs; let the matter wait, if only for a day or two, and the novelty has died out.

Some time ago I attended a field day of the Midland Motor Cyclists' Volunteer Corps, and left them about midday at Warwick. Knowing that they would assemble at 6.30 at the Stonebridge Hotel, I slipped back to Birmingham, developed my plates, posted a set of prints to *The Motor Cycle*, and took another set to Stonebridge to await the arrival of the men. The result was great astonishment and a good number of orders.

I recently attended a wedding on the outskirts of Birmingham, and learned that the bride and bridegroom were leaving on the 2.45 p.m. for Euston, the same train by which I proposed sending my photographs to the London papers. The work was done, and the bride and bridegroom were presented with a photograph of the wedding group before the train left the station. Had I depended on a tram, I should have had to send undeveloped plates to a London paper, and should not have received the order I did from the bride and bridegroom. In addition, I should

One Bank Holiday it was suggested that pictures taken at the seaside would be suitable for the day following the holiday. As we have many readers in Wales, I rode over in the morning to Bangor, and in the afternoon returned, stopping at the popular places on the coast and taking various pictures of a holiday nature. The following morning the *Daily Post* reproduced snaps taken at Bangor, Llanfairfechan, Penmaenmawr, Conway, Llandudno, Colwyn Bay, Rhyl, Prestatyn, etc. Of course this could have been done by a car, but consider the cost. This item of cost is all in favour of the motor cycle.

**An Appreciation of a Reliable Mount.**

This is my second Zenith. The first, a 6 h.p., served me well for two and a half years. Then I exchanged it for one of the latest 8 h.p. machines, which I received last June, and since then I have run, mostly with sidecar attached, 2,700 miles. The original belt is still on, and looks like new. The back cover I took off at 1,850 miles, and had it re-rubbered by Bates at a cost of about 12s. The original plugs are still in the engine, so beyond oil and petrol (the latter=70 m.p.g.) I have had no other expense. In the last fourteen years I have had at least that number of machines, but the present is proving the most satisfactory of the bunch.

MERCURIAL.

only have been able to send plates to one paper instead of prints to several.

**A Blow for the Londoners.**

A very big naval wedding, twenty miles from Birmingham, was attended by a number of pressmen from London. The village was on a branch line and the church some distance from the station. The London men had taxis to the station, a local train to the main line, and then a wait for the London train. By coming back to Birmingham at full speed I was able to send finished prints on the two-hour express, arriving in London within a quarter of an hour of the London photographers with undeveloped plates.

Having been previously connected with the motor trade, I have driven every powered car from a 6 h.p. single to a 60 h.p. six-cylinder, and every powered motor cycle from 1½ h.p. to 7.9 h.p., and I can safely say that I would not exchange my present outfit for any motor car, as I find it ideal for my require-

ments. The sidecar enables me to ride in traffic, grease, or dust, carry my cameras, clothing for the varying types of English weather, a big waterproof apron (which covers the whole outfit if I leave it in the rain), and, lastly, a good cart whip for dogs. I live in the country, one and a half miles from the station, and there are no trains on Sundays. This I could not do if it were not for the motor cycle. T. BLYTH CLAYTON.

T. Blyth Clayton, a Birmingham press photographer, who has had a 1915 3½ h.p. T.T. Sunbeam sidecar in continuous use for twelve months. He averages about forty miles per day seven days per week.

## WHAT IT COSTS.

Complete Running Expenses  
of Two Sidecarriers run by  
a Leeds Meat Purveyor.

Two of the three B.S.A. sidecarriers employed in a large butcher's business in Leeds. Two are kept in regular service and one in reserve.

SINCE 1912 Messrs. Isaac Stephenson, of Leeds, who are among the largest meat purveyors in the North of England, have employed motor cycles and sidecarriers for distribution purposes within Leeds city and environs, and during a chat with our representative, Mr. Stephenson, jun., expressed with much enthusiasm his views as to the usefulness and extraordinary economy of these machines.

It is quite usual, Mr. Stephenson explained, for customers to telephone for supplies as late as 10.30 in the morning, the goods to be delivered in time for preparation for the midday meal. By the old system of distribution complaints were regularly received and custom lost by delays in delivery, and Mr. Stephenson, jun., being a keen motor cyclist, finally advocated the use of sidecarriers.

### The Choice of Machines.

In 1912 two B.S.A. motor cycles, with extra strong sidecarrier chassis, were purchased, these being of the hub gear pattern, and though they gave long and excellent service (one, indeed, still being in use), Mr. Stephenson expresses a preference for the countershaft models, which, of course, is only to be expected. He speaks in high praise of the B.S.A. machines. The chain-cum-belt drive is found to be more suitable for this class of work than the all-chain drive, the elasticity of the friction system effecting a great saving where constant stopping and starting are to be done.

Two machines are employed on regular service, the third (hub gear model) being kept in reserve. Each of these machines does the work previously done by two delivery carts, and is infinitely more valuable than the latter as regards quickness in operation.

We append figures showing the total cost of maintaining two machines on the road and a third in reserve, and Mr. Stephenson states that one horse and cart costs approximately the same as one sidecarrier outfit—this being in normal times. Since the two machines accomplish the work of four delivery carts, however, a saving of 50% is effected in maintenance, and, what is of even greater importance, the services of two men are dispensed with, and wages, therefore, reduced to the same extent.

### Running Costs.

Each machine covers approximately 300 miles per week, and the figures below show all expenditures on the two outfits over a period of six months ended March 31st, 1916:

Petrol	...	...	...	...	£26 12 4
Engine and gear oil...	...	...	...	...	5 8 11
Tyres	...	...	...	...	11 0 0
Two new belts	...	...	...	...	1 8 2
Renewals	...	...	...	...	6 1 11
Repairs	...	...	...	...	13 0 6
Sundries	...	...	...	...	1 6 11
Insurance	...	...	...	...	7 0 0
Rent and rates of garage	...	...	...	...	5 4 0
Depreciation at 25%	...	...	...	...	18 0 0
					£95 2 9

Wages	...	...	...	...	£78 0 0
Maintenance per machine for six months	...	...	...	...	47 11 4½

By a curious coincidence this works out at a bare running cost of approximately 1d. per mile for each machine, which we consider rather unusually low. The figure is arrived at, it should be explained, by including the above items as far down as and including "Sundries" in the running costs. We should attribute it largely to the geared down belt transmission, with its saving in tyres and fuel.

### Small Points of Importance.

Women are now being educated to handle the machines; and, apart from all question of cost, Mr. Stephenson particularly emphasises the fact that the point of chief importance is the quickness with which deliveries are made, and the convenience thus enjoyed by customers.

Each rider is given one afternoon per week to administer a superficial overhaul, and as yet no engine or gear troubles have occurred. After covering a distance of 25,000 miles, one of the original machines was sold for £26 without sidecarrier, this being retained for attachment to the new model.

The cost of maintenance and the condition of the machine depend very largely on the driver, and no pains should be spared in teaching drivers the ordinary mechanics of motor cycling.

# THE CRAVING FOR LATEST WAR NEWS.

EXPRESS DELIVERY OF NEWSPAPERS BY MOTOR CYCLE.

A GROUP OF NEWSPAPER MOTOR CYCLISTS.

IN another part of this issue there is an article setting forth the advantages of the motor cycle for press photographers and journalists. Another branch of newspaper work in which motor cycles play their part is at the opposite end of the scale, i.e., in the delivery of the finished papers. Speed is everything in newspaper production, from the collection of the news to the delivery of the papers into the hands of the newsagents, and a more suitable vehicle than the two or three-wheeled motor cycle is difficult to find.

## Where the Sidecarrier Scores.

As the papers are printed, sidecarriers are "just the thing" to take parcels to various newsagents scattered over a big town and its suburbs. Many of the big London dailies employ this type of vehicle in addition to four-wheeled motor vans. The latter are very useful for taking big parcels to the railway termini for the distribution in the provinces, but for the smaller parcels for the Metropolis and suburbs the three-wheeler is used. It is extremely handy, occupies very little room, can dodge in and out of traffic easily, is speedy and cheap to run. The foregoing are essential points in a vehicle for newspaper work.

As the illustrations on this page show, sidecarriers for this class of work are not confined to London, many of the big provincial newspapers, employing them. In some cases the machines are owned

and ran by the newspaper firms themselves; in other, garages contract to deliver the papers for the newspaper proprietors.

As a result of the war the necessity of getting the newspapers delivered quickly has been greatly increased. Every morning and evening everybody wants a newspaper to see the latest news, and, whereas before the war a man would probably wait an hour or two if necessary to get his favourite paper, now he buys the first to hand.

## Newspaper Delivery Contractors.

We recently called on Mr. W. R. Webb, of the Waterloo Garage, Cornwall Street, S.E., who has running contracts with *The Daily Mail*, *The Evening News*, *The Star*, *The Pall Mall*, *News of the World*, and other papers. We found him in the act of tuning up a  $3\frac{1}{2}$  h.p. clutch Triumph, which is employed in the service of *The Daily Mail*. Having introduced ourselves, we entered his little workshop with him, and immediately espied a 1905-6 5 h.p. Minerva, which he pointed out to us as one of the "has beens." It had rigid forks, and the only sign of modernisation was the fitting of a chain-driven magneto, together with a box sidecar.

Leaving the newspaper offices with the boy in the sidecar covered with papers. The outfit is a single-cylinder  $4\frac{1}{2}$  h.p. James owned by Mr. Brittain, a newsagent of Balsall Heath, Birmingham. It has been in use for over twelve months, making two trips to the city daily.

TWO TYPES OF THREE-WHEELER FOR PROVINCIAL NEWSPAPER DELIVERY.

(Left) The Wall parcel car, the driver of which sits in front. It has a useful load capacity of 6 cwt. (Right) A big Rex sidecarrier used by the *Birmingham Gazette* and *Evening Dispatch*.

### The Craving for Latest War News.—

Mr. Webb has given up the use of solo machines for newspaper delivery, as the increased loads are now too heavy to be carried by one man, consequently the sidecar is used exclusively. Mr. Webb has another  $3\frac{1}{2}$  h.p. Triumph, also a clutch model, in the employ of *The Pall Mall*. On the roof of his garage he pointed out a great box which fits on his Chater-Lea. It takes three men to place it empty on the sidecar chassis. One of the most useful machines he has had under his care was a  $2\frac{3}{4}$  h.p. Douglas, which he bought second-hand. This dragged a large box 3ft. 3in. long by 2ft. broad attached to a sidecar big enough for a  $3\frac{1}{2}$  h.p., and used with a passenger on the carrier. This excellent little machine did 2,000 miles under his care before it was sold again, which is an exceedingly creditable performance for so small an engine.

### A Double Purpose Motor Cycle.

The machines—usually owned by the men who drive them, who are paid by the newspapers at the rate of 7s. 6d. for two hours—are kept in running order by Mr. Webb. They are employed for the purpose of taking papers from the big newspaper offices in the neighbourhood of Fleet Street to the various vendors, who occupy different stations in various parts of the great Metropolis. Six of these machines are maintained by the Waterloo Garage, which at the present moment is also employed in doing a good deal of military work in the shape of repairs to officers' motor cycles. Mr. Webb's favourite mount is the No. 7 model Chater-Lea, which we illustrate. This is employed by *The Star*, *The Daily Mail*, and *News of the World*. It does, like

A big Chater-Lea sidecarrier owned by A. E. Webb and used in the Metropolitan distribution of the *Daily Mail*. At week-ends a touring body takes the place of the box body shown.

other machines used in a similar capacity, seventy miles every day in the week, and during the week-end is usually taken for a good run for recreative purposes. So far it has run between 2,500 and 3,000 miles, and has proved itself extremely economical and reliable.

### A Manchester Example.

A Lancashire newspaper, the *Manchester Courier*, which recently stopped publication, employed in its motor delivery fleet six sidecars. The following particulars are from Mr. S. D. Wilson, the motor representative of the *Manchester Guardian*, who was previously in the service of the *Manchester Courier* in a similar capacity:

"Any urgent messages required quickly and speedily were unhesitatingly given to a 4 h.p. Bradbury to execute. The hand clutch and three-speed countershaft gear box fitted made it possible to thread the traffic of the city much quicker than was found to be the case with the other machines fitted with foot-operated clutch and two-speed hub gear.

### 200 Miles a Week.

"The life of a newspaper motor van, or sidecarrier, is a very arduous one. Newspapers are taken straight from the printing machines, and are dumped down in the waiting vehicle, then to be rushed round to the big railway stations for delivery in the country.

"In many cases only five minutes were given in which to get right across Manchester to the station, when traffic was perhaps at its thickest. This routine continues regularly every day from eleven o'clock in the morning until 8 p.m. There is very little time under these circumstances for repairs and readjustments, therefore a reliable turnout for the newspaper publishing business is absolutely essential. It must further be remembered that the machines ran through all weathers, over the inferior Manchester and Lancashire roads, for a period of twelve months. The approximate mileage can safely be put at 200 miles per week for each machine. The Bradbury was by far the most economical."

These few notes show unmistakably the fitness of the sidecarrier for newspaper work.

Some missionaries in Japan are finding motor cycles very useful in their work. At present there are six mounted on Harley-Davidsons.

THE CULT OF THE SIDECAR  
AMBULANCE.

In addition to combatant service, motor cycles are being used in various duties in connection with the war, not the least important of which is their adoption as ambulances. These illustrations show a few examples of motor cycle ambulances that have been evolved as a result of the war.

# "Bowden"

## Certain Control A wheel

The safety assured by "certain" control a wheel is too obvious to need much emphasis. To ensure it demands but your careful discrimination in the choice.

## BOWDEN BRAKES, Cables, & Fitments

are supremely suitable for every control of the modern motor cycle.

Their universal adoption proves this.

We manufacture a wide range of every type of Brakes, Cables and Control Fitments—every item of which is strongly designed, splendidly made, finely finished, fully tested for highly efficient service, and hence—is completely Dependable.

In case of any difficulty in obtaining Replacements, please write us direct. Ask now for our new illustrated Art Catalogue—interesting and instructive to all readers.

## MY 3-PHASE JET DAMPING CARBURETTERS

have such perfect vapourising properties that they enable you to use fuel at 1/4 per gallon in 42-gallon casks, which you are allowed to keep on your premises. Your engine will tick over dead slow, and pull dead slow in traffic, yet give the full power. It is almost impossible to tell you are not running on petrol at 2/6 a gallon. It cannot damage your engine or soot it up, and makes Motor Cycling possible in these times.

I give you my personal assurance of the truth of what is stated above. Please send at once for full particulars of the carburetter, and also for my Treatise on Carburation, and terms of One Month's Approval Trial.

# C. BINKS, Ltd., Eccles.

**YOU** cannot purchase a simpler or more perfect variable gear.  
**AS SUPPLIED TO HIS MAJESTY'S FORCES (MOTOR CYCLE SECTION)**  
**PHILIPSON'S Patent AUTOMATIC GOVERNOR PULLEY.**

(No holes or grooves in pulley flanges.)

This is the Governor which automatically regulates the Gear.

Douglas machines are wonderfully improved by fitting the Governor—Clutch models excepted.

See "The Motor Cycle," Jan. 7th, 1916, pages 4 and 5. Extract from article "Some Fads and Fancies," written by Captain A. B. Lindsay, M.B., writing of his 1914 and 1915 3½ h.p.—

"A 'Philipson' Governor Pulley was the only gear used, and with its aid the Machine climbed some alleged roads in Glamorganshire and Breconshire, where no Motor Cycle had ever been before."

Also writing of his 1915 Brooklands Road Special—

"A variable Pulley Gear fitted gave good service, but being severe on the average rubber belt, I substituted for it a 'Philipson' Pulley and fitted up a handle-bar control. This gave a very fine variable gear, and I have yet to find the ordinary road hill that I cannot climb. Belt wear has been slight."

**ACCEPT NO GEAR AS GENUINE UNLESS IT BEARS THIS TRADE MARK**

**ENTIRELY FREE** from troublesome and weighty complications—only **2 working parts**—no levers, rods, wheels, etc., to worry about. Simply takes the place of the ordinary pulley (**one nut only secures the complete gear to the engine**)—can be fitted without any alteration to most engines in a few minutes—Send for booklet.

## QUESTIONS

## REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Removing Obsolete Screws.

**?** My machine is a 1915 counter-shaft three-speed gear model, which has only run a few hundred miles, and now requires taking down for cleaning the carbon deposit from the cylinder, but I cannot remove the exhaust pipe or the auxiliary exhaust pipe. The latter is secured to the cylinder head by two screws which have become burnt in and cannot be moved. The other pipe is a tight fit in the cylinder head, and also in the exhaust box. I tried to get the exhaust box itself off, but it would not leave the pipes. If you can give me any suggestions I shall be glad.—S.P.

The only thing you can do is to use plenty of paraffin, i.e., apply it at intervals with lubricating oil to give it a chance to soak in. If the screws have been too firmly embedded to be removed in any other way they must be drilled out. Try a pipe spanner on the exhaust pipe.

## A Motor Cycle Used for Business.

**?** I have a pedal cycle with a sidecar attached, similar to a motor cycle and sidecar, only that my carrier is a box for carrying milk cans. I have recently attached an Auto-wheel to this, now making four wheels to my machine. As I use this solely for trade purposes—the cycle and carrier being specially built—I have not yet taken out a licence. I have used it with the Auto-wheel attached for about three months. The police now threaten me with a summons for not having taken out a licence. Do you think I ought to take out a licence, seeing that I use it solely for trade purposes?—Auto.

No. Under the circumstances you are not liable to pay any local taxation licence if the machine is used entirely for business purposes—that is, the transport of goods and merchandise—and provided you have conformed to the law by painting your name and address on the vehicle in letters at least one inch in height. You could not use the motor attachment, however, at any time for your own pleasure. You must, of course, have the usual registration and driving licences.

## The Endorsement of Licences

**?** Will you kindly inform me whether one's licence can be endorsed for not having the lamps alight at the proper time? I was fined 15s. 6d. in Derbyshire for this offence, and my licence was also asked for for endorsement.—NA 3916.

We regret to say that, under the circumstances, your licence could be endorsed. This is the case with every offence under the Motor Car Act, except for the first two for exceeding the speed limit.

One of a fleet of Lea-Francis sidecarriers supplied to the Chiswick Polish Co., Ltd., makers of Cherry Blossom boot polish, for the use of their travelling representatives.

## Fitting a Switch.

**?** Would you please tell me: (1.) What is the object or advantage of a cut-out switch, and would you advise one to be fitted on a 4 h.p. 1912 model with sidecar? (2.) Is it compulsory to have front and rear lamps on a motor cycle and one on the sidecar? Also, must two brakes be fitted?—E.E.B.

(1.) The object of a cut-out switch is that you have a means of stopping the engine in the event of the throttle not closing properly or the exhaust lifter breaking. (2.) It is compulsory at the present time to have a front and rear lamp on a motor cycle. A side lamp on the sidecar, to show the width of the vehicle, is also compulsory in certain districts and desirable in every district. Two independent brakes must be fitted to every motor vehicle.

## Noisy Valve Mechanism.

**?** I have a 4½ h.p. 1916 chain-cum-belt driven motor bicycle. Would you be kind enough to enlighten me on the following: Is there any practical method of silencing noisy tappets? I have fitted light buffer springs under the heads of the tappets to keep them always in contact with the valve stems, but without success.—B.P.

There are no means of effectively silencing a noisy valve gear, though the interposition of fibre heads to the tappets diminishes the clatter. You may also partially cure noisy tappets in the way suggested in your letter, but most of the noise comes from the cams and rockers themselves. It is a most difficult matter to silence tappet gear on a highly efficient engine with quick lifting cams.

## Timing the Spark.

**?** Will you please be good enough to answer the following questions: Spark advanced: Is this when ignition takes place, say, when the piston is at the top of its stroke? Spark retarded: Is this when ignition takes place before, say, 15° of the top of the stroke? If the latter assumption is correct, what is the maximum retardation in degrees in a 2½ h.p. Douglas? What is the usual firing point (a) for level running and speed, and (b) for hill-climbing? These are elementary questions, but the misunderstanding as to the correct meaning of retarded and advanced ignition prompts me to ask your assistance.—W.F.B.

No; when the spark is advanced the ignition takes place before the piston reaches the top of the stroke. With the spark retarded the engine fires just past the top of the stroke. The period of advance and retard on the average magneto is 30°, and the method of timing a machine for general use is as follows: Place the piston exactly on top of the compression stroke and connect up the magneto with the points just about to break and the ignition lever two-thirds retarded. This will mean that the explosion when the ignition is fully retarded will take place when the piston has travelled about 1.5 mm down the firing stroke.

## PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the amount of paper material by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

**Running on Paraffin.**

Q.

I shall be much obliged if you will let me know if I could satisfactorily run my 1914 6 h.p. twin motor cycle on paraffin. I have previously run a 3½ h.p. on this fuel in an emergency. Would it do any damage, and could any slight alterations be made to improve the running on this mixture? I presume for starting I could heat the carburettor. If I cannot use this I shall have to give up motor cycling.—W.B.C.

You can run the engine satisfactorily on paraffin, after first starting up on petrol, but it would be better to have a mixture of, say, two-thirds paraffin and one petrol, or, better still, half and half, since, unless the combustion is perfect, there is a liability to excessive carbonisation and pre-ignition. It would be necessary to take in hot air to the carburettor, so as to render the combustion as nearly perfect as possible. You would be well advised to study readers' experiences, which have appeared in our correspondence columns for some time past.

**Failure on Hills.**

Q.

I should be greatly obliged if you would tell me the reason for my motor cycle failing on hills. It is an old Excelsior, fitted with accumulator ignition. It goes all right on level roads, but generally fails on anything worthy of the name of a hill. I am told that the cylinder and piston are new. Do you think it is possible to have too much compression, as this really represents the symptoms when brought to a standstill on an incline? Everything, as far as I can see, is in good working order, and I can always get a good spark.—A.G.

The trouble is possibly due to over-heating. If the piston is new it is quite possibly a tight fit in the cylinder, and when the engine gets hot there is a

tendency for the piston to seize. Possibly, also, the piston rings are a shade tight. In either case the trouble will probably disappear after a little running. Are you giving sufficient oil? If doubtful, try a pumpful every eight miles until the new piston and cylinder are run in.

**READER'S REPLY.****Difficult Starting.**

I see endless queries in your paper re difficult starting, and some three weeks ago there was such a query from a reader with a similar gear to mine. He proposed fitting a decompressor. I am a novice, and I used to find starting an abomination. Many times I exhausted myself, and once or twice I had to give the job up. Perhaps my unorthodox plan may be of use to sufferers. I found the decompressor of little help, and for some reason the injection cock was removed from the cylinder head when the decompressor was fitted. I now unscrew the plug, inject a little petrol with an ordinary oiler, and turn the engine over a few times *with the plug out*. A drop of petrol on the plug points, the plug replaced, throttle about one-third open, air closed, spark almost fully advanced, and it fires first time. The whole job takes less than five minutes, and saves knuckles, energy, and language! Perhaps I am doing something silly, but if your correspondent will try the dodge he will probably find it as effective as I have done. The only thing I can see is that the plug asbestos washer may need more frequent renewal.—TYRO.

[It is a laborious method to remove the plug. The same effect would be obtained by injecting a squirt of paraffin occasionally whilst turning the engine over. We should therefore recommend our correspondent to remove the decompressor, which, he says, is of little use, and replace the compression tap.—ED.]

**RECOMMENDED ROUTES.****COVENTRY TO HEDNESFORD.—H.N.**

Coventry, Stonebridge, Castle Bromwich, Erdington, Brownhills, Cannock, Hednesford.

**WALKDEN (LANCS) TO WARSOP (NOTTS).—A.B.**

Walkden, Worsley, Patricroft, Stretford, Stockport, Chapel-en-le-Frith, Balstow, Chesterfield, Mansfield, Warsop.

**NEWPORT (MON.) TO MANCHESTER.—A.J.R.**

Newport, Usk, Raglan, Monmouth, Hereford, Leominster, Ludlow, Craven Arms, Church Stretton, Shrewsbury, Whitechurch, Tarporley, Northwich, Altrincham, Manchester. Approximately 160 miles.

**CASFLEFORD TO WIGTON.—E.C.**

Castleford, Aberford, Wetherby, Boroughbridge, Leeming, Scotch Corner, Barnard Castle, Bowes, Brrough, Appleby, Penrith, Skelton, Sebergham, Wigton. Approximately 123 miles.

**WELLS TO PLYMOUTH.—C.B.**

Wells, Glastonbury, Dürston, Taunton, Wellington, Cullompton, Exeter, Chudleigh, Ashburton, Ivybridge, Plymouth. Approximately 58 miles.

**CLAPHAM COMMON TO CLACTON-ON-SEA.—R.J.S.**

Clapham, Victoria Bridge, Buckingham Palace Road, Grosvenor Place, Park Lane, Oxford Street, Orchard Street, Marylebone Road, Albany Street, Seven Sisters Road, straight away to Tottenham, then make your way along the road leading to Epping Forest, past Blackhorse Road Station, and straight on till you come to Woodford, then go through Epping, Ongar, Chelmsford, Witham, Colchester, to Clacton.

**THE MOTOR CYCLE FOR BUSINESS PURPOSES IN AUSTRALIA.**

Five of the organisers of the Australian Workers' Union, with their L.M.C. machines, who travel to very remote parts of the Commonwealth. The long journeys over rough roads and through scantily populated country are a good test for the machines. On the carriers the men carry their "swags," weighing about 150 lb.

# TYRE ECONOMY

## SPECIAL CLEARANCE LINES (Discount allowed to the Trade.)

Continental Autobi for-voiturette Rims.

Specially suitable for heavy machines.  
650 x 65, 21/6 List Price, 39/6.

### TYRES for TRADESMEN'S SIDECARRIERS.

Extra heavy tyres are necessary to withstand the hard and constant work that a Sidecar is called upon to perform day by day.

Here is an opportunity to secure, at specially low prices, tyres that are eminently suitable for the purpose.

By purchasing either of these special lines, Tradesmen can ensure economy in running and freedom from tyre troubles.

Special attention is drawn to the thickness of the treads, which means long life.

Continental T.T. Studded Heavy.

26 x 2 1/2 .. 21/6. List Price 34/-

Elite Heavy.

Guaranteed 3,000 miles.

Suitable for 3 1/2 h.p. machines.

**ELITE RUBBER Co., Ltd.,**

266, Vauxhall Bridge Rd., Victoria, S.W.

Phone: Victoria 6553.

One Minute Victoria Station.

In answering this advertisement it is desirable to mention "The Motor Cycle."

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

# VINDEC

## MOTOR BICYCLES.

### The "VINDEC" 2½ h.p. Two-speed Two-stroke Lightweight Model.

#### SPECIFICATION.

ENGINE—"Vindec," 2½ h.p., 61×70 mm., 2-stroke, 226 c.c., large steel fly-wheel; transfer port cast integrally with cylinder; release valve detachable, with auxiliary exhaust pipe. IGNITION—High-tension waterproof magneto, chain driven, in dustproof aluminium case. CARBURETTER—Amac. GEAR—2-speed, operated by dog clutch on countershaft; direct drive on both speeds, with simple adjustment for chains; ratio, 5½ to 1. FRAME—Loop type, very low saddle position; long wheelbase. SPRING FORKS—Girder type, Druid licence. BRAKES—Front rim brake, hand applied; rear belt rim brake, heel applied. TRANSMISSION—Chain drive (Hans Renold heavy, ½ in.×½ in.) from engine to countershaft; belt drive from 5½ in. pulley on countershaft to back wheel by ½ in. Dunlop.

CHAIN CASES—Pressed steel, enclosing entirely all chain transmission. WHEELS—26×2 in., N.P., heavy gauge, rims centred and lined. TYRES—26×2 in. Dunlop motor cycle. TANK—Strong tinned steel, with one longitudinal seam; large filler caps. Capacity: petrol, 1 gallon; oil, one quart. LUBRICATION—Direct forced feed to main shaft and big end bearing from hand pump to tank; auxiliary cylinder lubrication by oil mixed with petrol. MUDGUARDS—Front valanced whole length, with forward extension; rear wide section, with extension over belt rim. CARRIER—Strong tubular. REAR STAND—Fixed to back forks, independent of wheel spindle. SADDLE—Pan seat. FOOTBOARDS—Anti-vibratory. TOOLS—Complete set of special spanners, adjustable spanners, screw-driver, pliers, etc., in tool roll; celluloid inflator. FINISH—Black enamel, wheels plated, and enamelled black centres and red lined; tank, dark grey, with light grey panel and black and gold lines. Weight, 150 lb.

PRICE **38** GUINEAS.

*Write for the "Book of the Vindec."*

### The "VINDEC" 6 h.p. Motor Cycle and Sidecar Combination.

#### SPECIFICATION.

ENGINE—6 h.p. twin-cylinder J.A.P., side by side valves; patent forced lubrication, and internal exhaust lifter; 76×85 mm., 770 c.c. MAGNETO—Splitdorf, adjustable, handle-bar control. CARBURETTER—Latest model Amac. LUBRICATION—Best & Lloyd, semi-automatic, sight feed. GEAR—Sturmey-Archer 3-speed countershaft, clutch, hand-controlled; exceedingly efficient kick starter. TRANSMISSION—Renold's chain, and rim. Dunlop belt over large pulley. FRAME—Built with reinforced tubes, extremely strong head design. FRONT FORKS—Druid, heavy pattern. TANK—Tinned steel, with one longitudinal seam; large filler caps, with bayonet fastening. CHAIN COVER—Steel, designed to eliminate noise and rattle. MUDGUARDS—Special wide, with extra deep valances. STANDS—Front and rear tubular, independent of wheel spindles. CARRIER—Strong tubular, with two armoured pannier bags. TYRES—26×2½ in. Dunlop heavy (also on sidecar). SADDLE—Brooks' B170 pan seat. TOOL KIT—Comprising all tools necessary for ordinary adjustment. FOOTBOARDS—Distinctive solid aluminium, shaped to suit foot. FINISH—French grey, and lined red; sidecar painted and picked out to match.

PRICE **88** GUINEAS.

SIDECAR: CHASSIS—Scientifically designed to incorporate lightness and grace with strength; 4-point connections; quick-detachable fittings. WHEEL—Extra wide, heavy hub; fitted with Dunlop 26×2½ in. tyre. BODY—Panelled wood with solid-built back, luxuriously upholstered spring back, ample seating room; tool locker under seat and pockets in upholstery, with waterproof apron.

# MIDLAND

## MOTOR CYCLE TYRES.

## WHY IS IT

that you should insist on buying **MIDLANDS** when buying Motor Cycle Tyres?

Because "Midlands" are the last word in Motor Cycle Tyres. They are the result of years of investigation and practical experience. The product of manufacturers whose experts are not merely rubber and tyre experts but practical motor cyclists and that says a lot. Nevertheless the price is no more than you would pay for tyres of other makers.

## "There's a good Time Coming!"

**Prepare for it NOW**

**T**HE Bradbury Factory, from the very early days of the war, has been utilised to its utmost capacity in meeting the demands of the Government, with the consequence that we have not been able to keep pace with the requirements of our numerous Motor Cycle customers.

But "there's a good time coming," and when that time arrives many improvements will be embodied in the Bradbury Motor Cycles and their efficiency further enhanced because of the extensive experience we are gaining to-day. That experience will be at your disposal.

The new Bradbury Models—and particularly our new 2 $\frac{3}{4}$  h.p. Lightweight Model—will, we feel confident, strongly appeal to you. It will pay you to wait until these new Models are at your service. They will be found well worth waiting for.

**BRADBURY & CO., LTD.,**  
Wellington Works,  
OLDHAM.

# The Bradbury

*"The machine that makes waiting worth while."*

# *The BRITISH* "EXCELSIOR"

## The Most Economical

**T**HE most economical means of travel is the Motor Cycle. The most economical motor cycle is the British "Excelsior," because, being strongly built with a good sound engine, it lives long. It runs smoothly—wear and tear being the least possible. There is always an ample reserve of power. British "Excelsiors" are built for long service—and to give that service at the lowest cost. You may pay more for a motor cycle, but you cannot buy better value; you may pay less, but you may not save money—in the long run.

THERE is a British "Excelsior" to suit everybody — six models from 2½ h.p. to 8 h.p. The 2½ h.p. is ideal for either town or touring. Easy to control, inexpensive to buy and maintain, Early delivery.

## The ROYAL ENFIELD Way Pays Best.

Royal Enfields are doing good service in the business world to-day. Under ordinary conditions, with loads averaging from 2 cwt. to 3 cwt., there is no more advantageous way of delivering goods than by means of a Royal Enfield Sidecar Combination.

The all-chain driven Royal Enfield is specially suitable for this class of work. It is reliable to the highest degree, and its economy in petrol consumption and running costs is remarkable. Recent tests carried out with a Royal Enfield at Brooklands by "The Motor Cycle" gave an average of 76 miles to the gallon.

We can quote actual instances of where Royal Enfield Models are carrying goods of all descriptions—differing as widely as butcher's meat and builder's materials—and doing it day after day without trouble. We shall be pleased to send our catalogue, with full particulars of this model, on request. Mention "The Motor Cycle" when writing.

## The Originality

which has secured for Sphinx plugs their position of Honour throughout the world also finds expression in the mode of their packing.

The arrangement is such that without breaking the seal which holds the

# SPHINX

plug in the box, the lid may be lifted, revealing a removable card fully descriptive of the type of plug. Thus the obvious merit of sealing is coupled with the equally essential advantage of knowing precisely whether the plug under the seal is the pattern suitable for the purpose in view.

Interesting booklet showing the various types of Sphinx plugs free on request.

# Genuine Testimony

— is valuable to YOU — read this — which proves high claims made for the  
 “New Imperial Light Tourist” are easily within the actual facts.—

SOUTHSEA, MAY 29TH.

“I thought that you might be interested to know of a splendid run that I have just had on my ‘New Imperial’ 2½, from Southsea to Birmingham — a distance of 146 miles — on 7 pints of petrol, which you will find works out at 167 miles to the gallon. I should think this would constitute a *Record*, and I should be glad to know if you have a better. I may say that I can prove the above statement at any time. I may also add that since riding the machine, which I had new in January, 1915, I have done 4,000 miles, and have not had a single adjustment to the machine. This, coupled with the above petrol consumption, speaks well for the machine as a whole.”

Yours truly, E. C. HENLEY.

In answering these advertisements it is desirable to mention "The Motor Cycle."

# Clyno Utility

## As a Passenger machine

the CLYNO'S supremacy is indisputable. Designed and built as a complete unit—efficient and dependable in the highest degree—it offers a service that is quite exceptional, and well merits its title "THE Sidecar Combination."

## As a Commercial vehicle

the CLYNO has proved of great value. Its marked simplicity, efficiency, and economy are features that have made it essentially THE machine for speedily and economically "delivering the goods."

## As a War Service machine

the utility of the CLYNO has been most strikingly demonstrated—it is being utilised for carrying quick-firing guns, for conveying wounded soldiers, for despatch work, and many other Military duties—and its exceptional service has won for it a great reputation as THE Military motor cycle.

To-day our entire output of CLYNOS is required for War Service—but in the future CLYNO supremacy will be greater than ever, and—whether you require a Passenger machine, or Commercial vehicle, you'll find the CLYNO perfectly meets your requirements. Keep the CLYNO in mind.

“—just the goods for the two-stroke”

thus “Ixon,” in “The Motor Cycle” last week, describes the FORWARD (Type D).

Explaining that after having to discard over £5 worth of Plugs on account of their “business ends” being “extremely foul,” “Ixon” says—

“I am now using a FORWARD Plug which has a detachable insulator . . . it seems to be just the goods for two-strokes, which soil their plugs so quickly.”

Type D, illustrated above, is the plug referred to. It can readily be taken apart for cleaning. Price 3/-

**FORWARD**

EXCEPTIONAL Offer for month only, in order to advertise British made motor tyres and belts, absolutely new, direct from works, with makers' guarantee. We will supply any size tyre or tube at reduced prices. Agents wanted for Kumpel, the famous petrol substitutor.—Kemp's Rubber Works, Hardman St., Manchester. [7527]

## FORWARD Fasteners

bring and hold the ends of the belt close together.

Belt-end protectors — necessary with fasteners which fail in this respect — are not needed; hence, an outlay often equal to the cost of the fastener itself is entirely obviated.

Further, in bringing the ends close together the FORWARD ensures a greater length of belt beyond the rivets, thus avoiding the likelihood of strain and the consequent risk of the rivets pulking through.

The strongest fastener on the market — made in five sizes, 5in., 7in., 7½in., 1in., and 1½in. Price 1/6 each.

OUR  
WEEK-BY-WEEK

TALKS ON

B E L T  
D R I V EJUNE  
29.

ONCE AGAIN we beg leave to draw attention to a little filament that gives big results in added efficiency, increased speed, and longer wear of the belt. Every rider knows the familiar "click" made by the belt fastener as it passes over the engine pulley: it indicates wear on both, whilst the belt ends suffer from being insufficiently supported. These troubles can be cured by fitting a

STANLEY  
"SPARE  
LINK."

Try it yourself; it costs but 1/-, which will be saved over and over again in longer wear of belt, of fastener, and of engine pulley, as well as in the increased freedom from trouble. The illustration shows it in use.

As supplied to the British and Allied Armies.

"LION" Fastener, Guaranteed  
5,000 Miles . . . . . 6d.

Stanley Fastener, The ORIGINAL . . . . . 9d.

Stanley "Shield" . . . . . 8d.

Stanley "Adjusting Hooks" . . . . . 6d. for 3

Stanley Belt . . . . . 1/3 to 2/5 per foot.

(A Stanley Fastener given free with each Belt.)

10% increase on Belting only.

Two interesting booklets sent on request by postcard.

STANLEY MOTOR BELT  
& FASTENER CO.

(Inventors of the Original Hook  
Fastener and other  
practical Belt Aids).

**TYNESIDER CARRIER SEATS**  
FROM **5/6** UPWARDS.  
DELIVERY FROM STOCK.

Send for new illustrated price list.

The new Tynesider Carrier Seat folds up as shown above. Can be used for either passenger or fragile goods. A compact emergency seat. It is an ideal seat for light or heavy weights, sidecar combinations, and improves the appearance of the outfit. Mounted on a special spring attachment, it is self-balancing, absorbs road shocks, and adds to safety of carrier riding, while the spring rods work in guides on the principle of a piston—thus preventing sideways. All adjustable, and will fit any carrier. Price, complete with reversible cushion, 18/6; without the backrest, 12/6. Seat, complete with clips, but without springs or backrest, 5/6. Tynesider Bucket-shaped Pillion Seats, from 15/6 to 35/6. Children's, 14/6, with safety strap.

### THE LAST WORD in MOTOR CYCLE SEATS.

The essence of comfort is the Tynesider Bucket Seat. Low position, surpasses pan seats, beautifully sprung, no sidesway.

Can be detached and used as a Pillion seat. Cost less than a saddle. 21/- complete, with adjustable clip to fit Indian or any other cycle.

Without springs, 15/6. Better quality, 27/6. Superior quality, 36/6 complete.

Ask your dealer to get one for you.

The Excelsior Tyre & Rubber Co., Hurst St. Birmingham

### A LADY ADVERTISER

writes:

"I was very pleased with the advertisement in your paper, having had about forty answers."

Ladies requiring to buy or sell a second-hand motor cycle, will find "The Motor Cycle" the most satisfactory medium.

## ? What is WRONG with the Machine.

How often motor cyclists ask this question when mysterious troubles arise—and how difficult it is at times to trace the fault!

### TIME and TEMPER

can be saved by purchasing a copy of

## "TRACING TROUBLES"

which gives a reliable method for locating every possible fault to which a motor cycle is liable, together with a remedy for every fault.

Third Edition.

Price 1/- net. By post 1/2.

From ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C., and all leading booksellers.

# We Hold Large Stocks !

**D**ESPITE the difficulties occasioned by the War, we can execute all orders for Ferodo fabrics on the day of receipt. There is not the slightest necessity to have your motor car or your machinery lying idle for days when the clutches or brakes require re-lining, just because your garage man or mechanic has no stock. Nor is there any need to be content with inferior fabrics or make-shifts. **WIRE US**, and we will fill your order *right away*. The most efficient, the most durable, and the most economical friction surface made :

# THE MOTOR CYCLE <sup>1D</sup>

JUNE 29TH, 1916.

Upton Villa, Hayle.

April 9th, 1916.

I have been an enthusiastic rider of one of your 2½ h.p. four-stroke machines for the last five months, and have been close on 1,000 miles over some of the worst roads in the country. I have had no trouble whatever, and the machine runs perfectly. My machine is now running just over 100 miles to the gallon. I have just examined my cones, and they are perfectly good, and have not been adjusted since I had the machine

(Signed) J. R. T. BATE.

This is from an every-day motor cyclist. We get letters like this almost every day, genuine expressions of opinion of the Royal Ruby. Don't put off the pleasure of discovering the value and merits of the
